Introduction:

Fabrication of complete dentures combines biological sciences with sound mechanical principles. The ultimate goal in prosthetic dentistry is to fabricate a prosthesis that integrates seamlessly with the patient's stomatognathic system, ensuring both function and aesthetics. In complete denture fabrication, dentists have control over multiple factors related to the prosthesis[1]. Although natural tooth-related issues such as mobility, caries, or malpositioning are no longer concerns, new challenges arise in ensuring that the prosthesis aligns with soft tissues for optimal functionality and aesthetic appeal[1,3].

The Glossary of Prosthodontic Terms-8 defines the occlusal plane as the "average plane established by the incisal and occlusal surfaces of the teeth," which is typically not flat, but a mean curve[2]. Proper occlusal plane orientation is essential for aesthetics, occlusal balance, and denture function[4]. Incorrect positioning can lead to problems such as food accumulation, cheek or tongue biting, and denture instability, potentially causing soft tissue changes and bone resorption. A well-aligned occlusal plane supports a balanced dental occlusion[5].

The occlusal plane is generally aligned anteriorly to interpupillary line for aesthetic purposes and posteriorly parallel to Camper's plane, which extends from the lower part of the nose (acanthion) to the external auditory meatus[6]. The ala-tragus line has traditionally been used to establish this plane, but debate persists about which part of the tragus will be taken as reference. Additionally, the impact of aging on the position of the ala-tragus line has only recently been studied[7].

In younger adults, using the inferior border of the tragus as the posterior reference resulted in a more parallel occlusal plane, while in older individuals, the middle of the tragus served as a better reference point. These findings suggest that age-related facial changes influence the optimal reference point for establishing the occlusal plane[1,5].

Relocating the occlusal plane in edentulous patients presents a challenge. For occlusal rehabilitation , aligning the lost occlusal plane with the maxillary plane is more reliable than with the mandibular plane, as the

Abstract
This study explores the correlation between the horizontal visible iris diameter (HVID) and the visible iris length with the mesiodistal width and cervicoincisal length of the maxillary central incisor using digital image analysis. Accurate anterior teeth selection plays a critical role in denture aesthetics, influencing facial harmony and psychological well-being[1]. While previous studies suggest some correlations between ocular and dental dimensions, the reliability of these metrics for anterior tooth selection remains uncertain. This study aims to assess whether such correlations can offer predictive value for selecting anterior teeth in edentulous patients.

Abstract

Background

Intraoral scanners have revolutionized the field of dentistry by providing a more efficient, accurate and patient-friendly alternative to traditional dental impressions. This article explore the advancements in intraoral scanning technology and its impact on digital impressions and restorations.

Discussion

It highlights the revolutionary effect these technologies have on modern dentistry, emphasizing the benefits they offer in terms of precision, effectiveness, patient experience, collaboration, integration with CAD/CAM technology and general practice success. The use of intraoral scanners into workflows in dental practices, with a focus on how these devices might improve communication between dental practitioners and laboratories and streamline procedures.

Summary

An intraoral scanner is a digital dental tool that captures precise 3D images of a patient's teeth and gums. It enhances diagnostic accuracy, improves treatment planning, and streamlines workflows, replacing traditional impressions with faster, more comfortable, and efficient scanning methods.

Conclusion

An intraoral scanners has shed light on the significant advancements and benefits that these devices bring to the field of dentistry. By improving accuracy, reducing turnaround times, and enhancing patient comfort, intraoral scanners have revolutionized the way dental professionals capture impressions and collaborate with laboratories.

Keywords: Intraoral scanners, Accuracy, Time efficiency

INTRODUCTION

Intraoral scanners (IOS) have revolutionized prosthodontics by offering a digital alternative to traditional impression techniques. These cutting-edge devices capture highly accurate three-dimensional (3D) images of the oral cavity, streamlining workflows and enhancing patient experience. Unlike conventional impressions, which involve the use of impression materials that can cause discomfort or inaccuracies, IOS provides a non-invasive, precise, and efficient method for creating digital impressions.[1,2]

The integration of intraoral scanning technology into prosthodontics aligns with the broader trend of digitization in dentistry. It has significantly improved the accuracy and efficiency of procedures, including crowns, bridges, veneers, dentures, and implant-supported restorations. Additionally, IOS technology facilitates seamless communication between clinicians, dental laboratories, and CAD/CAM systems, ensuring faster production and improved outcomes for patients.[3]

As the demand for accuracy, efficiency, and patient comfort continues to grow, intraoral scanners are becoming an essential tool in modern prosthodontic practice. Their ability to enhance treatment planning, reduce chair time and improve patient satisfaction marks a paradigm shift in the field, setting new standards for dental care.

MECHANISM

Intraoral scanners function by using a combination of optical and laser technologies to capture detailed 3D images of the oral cavity. As the scanner is moved

[7]PG student MIDSR Dental college

Abstract
Dental implants have emerged as a highly reliable and esthetically pleasing modality for the replacement of missing teeth, offering long-term benefits in terms of function, comfort, and preservation of oral structures. Despite their proven clinical success, the decision to undergo implant therapy is significantly influenced by patient perceptions, socio-economic factors, awareness levels, and individual health considerations. This study presents a detailed examination of the acceptance patterns of dental implants among partially edentulous individuals, exploring the demographic and clinical factors associated with their choices. The observational data, derived from a cohort of 325 patients aged 21–80 years, highlights that only 30.4% opted for dental implants, while the majority preferred fixed partial dentures (FPDs) or removable prostheses. Motivators for implant acceptance included improved chewing function, oral health enhancement, esthetics, bone preservation, and durability, whereas deterrents encompassed cost, fear of surgery, systemic health issues, lack of knowledge, and time constraints. Correlation analysis revealed that younger age, higher education, urban residency, and better oral health awareness were positively associated with implant demand, while a higher number of missing teeth negatively correlated with implant selection. This article integrates these findings within the broader global and Indian context, critically analyzing the underlying socio-economic, cultural, and clinical influences on treatment decisions, and proposes strategies to enhance implant acceptance through targeted awareness programs, cost-reduction initiatives, and tailored patient counseling.

Introduction

Tooth loss remains one of the most significant oral health challenges worldwide, impacting not only masticatory efficiency but also speech, facial esthetics, psychological well-being, and overall quality of life. In the Indian context, the prevalence of partial edentulism is notably high, with national estimates indicating that nearly 58.8% of the adult population suffers from the loss of at least one tooth, while 10.7% experience complete edentulism. The burden is disproportionately greater in rural areas, where limited access to dental

Abstract:
The rapid evolution of digital technologies has significantly transformed dental practices, particularly in prosthetic and aesthetic treatments. While intraoral scanners and CAD/CAM systems are now standard tools, the integration of facial scanners marks a new frontier in digital dentistry. These devices capture detailed 3D representations of the face, offering valuable data for diagnosis, treatment planning, and patient communication.

Keywords: Face-scan, Digital workflow, Digital dentistry, Virtual patient, Scanning technologies

Introduction:
The adoption of CAD/CAM systems in dentistry has streamlined prosthetic workflows and reduced clinical chair time. Tools like intraoral scanners (IOS), cone beam computed tomography (CBCT), and digital photography have enabled clinicians to construct comprehensive virtual models of their patients—commonly referred to as "virtual patients ." One persistent challenge, however, lies in accurately orienting the maxilla in 3D space relative to facial reference lines. Traditional computerized facebow systems, while effective, are often expensive and complex. Facial scanners offer a promising alternative by capturing extraoral structures and integrating them into the digital workflow. Recent developments, including smartphone applications, have made this technology more accessible and user-friendly.

Applications of Facial Scanners:
1. Virtual Patient Records
Facial scanners can digitize extraoral records, replacing analog facebows and diagnostic wax-ups. By merging face scans, intraoral scans, and CBCT data using landmark-based superimposition (e.g., dentition), clinicians can create a 3D virtual patient. This model supports treatment simulation, enhances communication, and facilitates non-invasive documentation.

While current systems struggle to integrate DICOM, STL, and OBJ files into a single platform, researchers like Joda and Gallucci have proposed the development of a 4D virtual patient—incorporating facial movements and virtual articulation data. Techniques such as stereophotogrammetry and reference-point scanning are being explored to improve accuracy and usability.

2. Maxillofacial Prosthesis
Combining facial scanners (e.g., 3dMDface) with intraoral scanners (e.g., TRIOS 4) enables precise design of prostheses for patients with facial defects. This method captures both facial topography and fine surface textures, allowing for accurate reproduction using 3D printing—often eliminating the need for manual sculpting.

3. Obstructive Sleep Apnea (OSA)
OSA is a serious condition linked to airway obstruction during sleep. While polysomnography remains the diagnostic gold standard, facial scanners have emerged as a supplementary tool. Algorithms based on 3D facial scans can help predict OSA severity. Additionally, custom CPAP masks designed using facial scan data offer improved comfort and reduced air leakage.

Types of Facial Scanners:

Type	Description	Examples
Phone-based	Handheld apps using smartphone cameras (e.g., TrueDepth)	Bellus3D DentalPro, Qlone
Handheld	Portable scanners moved around the face to build a 3D image	MetiSmile by SHINING 3D
Desktop	Stationary units with multiple cameras and lighting for high-resolution scans	RAYFace, Obi Scanner, VECTRA H2

The aesthetic restoration of edentulous patients relies heavily on the correct selection of maxillary anterior teeth. In prosthodontics, the dimensions of the central incisors significantly impact the appearance, lip support, and phonetics. Choosing anterior teeth that align with facial features ensures harmony between dental and facial aesthetics, contributing to a patient's confidence and self-esteem[2].

Anthropometric and biometric approaches, such as using the intercanthal distance or interpupillary distance, have been explored to aid in anterior tooth selection. Recent studies suggest that the Horizontal Visible Iris Diameter (HVID) and visible iris length may

Introduction:

Fabrication of complete dentures combines biological sciences with sound mechanical principles. The ultimate goal in prosthetic dentistry is to fabricate a prosthesis that integrates seamlessly with the patient's stomatognathic system, ensuring both function and aesthetics. In complete denture fabrication, dentists have control over multiple factors related to the prosthesis[1]. Although natural tooth-related issues such as mobility, caries, or malpositioning are no longer concerns, new challenges arise in ensuring that the prosthesis aligns with soft tissues for optimal functionality and aesthetic appeal[1,3].

The Glossary of Prosthodontic Terms-8 defines the occlusal plane as the "average plane established by the incisal and occlusal surfaces of the teeth," which is typically not flat, but a mean curve[2]. Proper occlusal plane orientation is essential for aesthetics, occlusal balance, and denture function[4]. Incorrect positioning can lead to problems such as food accumulation, cheek or tongue biting, and denture instability, potentially causing soft tissue changes and bone resorption. A well-aligned occlusal plane supports a balanced dental occlusion[5].

The occlusal plane is generally aligned anteriorly to interpupillary line for aesthetic purposes and posteriorly parallel to Camper's plane, which extends from the lower part of the nose (acanthion) to the external auditory meatus[6]. The ala-tragus line has traditionally been used to establish this plane, but debate persists about which part of the tragus will be taken as reference. Additionally, the impact of aging on the position of the ala-tragus line has only recently been studied[7].

In younger adults, using the inferior border of the tragus as the posterior reference resulted in a more parallel occlusal plane, while in older individuals, the middle of the tragus served as a better reference point. These findings suggest that age-related facial changes influence the optimal reference point for establishing the occlusal plane[1,5].

Relocating the occlusal plane in edentulous patients presents a challenge. For occlusal rehabilitation , aligning the lost occlusal plane with the maxillary plane is more reliable than with the mandibular plane, as the

Abstract:
The rapid evolution of digital technologies has significantly transformed dental practices, particularly in prosthetic and aesthetic treatments. While intraoral scanners and CAD/CAM systems are now standard tools, the integration of facial scanners marks a new frontier in digital dentistry. These devices capture detailed 3D representations of the face, offering valuable data for diagnosis, treatment planning, and patient communication.

Keywords: Face-scan, Digital workflow, Digital dentistry, Virtual patient, Scanning technologies

Introduction:
The adoption of CAD/CAM systems in dentistry has streamlined prosthetic workflows and reduced clinical chair time. Tools like intraoral scanners (IOS), cone beam computed tomography (CBCT), and digital photography have enabled clinicians to construct comprehensive virtual models of their patients—commonly referred to as "virtual patients ." One persistent challenge, however, lies in accurately orienting the maxilla in 3D space relative to facial reference lines. Traditional computerized facebow systems, while effective, are often expensive and complex. Facial scanners offer a promising alternative by capturing extraoral structures and integrating them into the digital workflow. Recent developments, including smartphone applications, have made this technology more accessible and user-friendly.

Applications of Facial Scanners:

1. Virtual Patient Records
Facial scanners can digitize extraoral records, replacing analog facebows and diagnostic wax-ups. By merging face scans, intraoral scans, and CBCT data using landmark-based superimposition (e.g., dentition), clinicians can create a 3D virtual patient. This model supports treatment simulation, enhances communication, and facilitates non-invasive documentation.

While current systems struggle to integrate DICOM, STL, and OBJ files into a single platform, researchers like Joda and Gallucci have proposed the development of a 4D virtual patient—incorporating facial movements and virtual articulation data. Techniques such as stereophotogrammetry and reference-point scanning are being explored to improve accuracy and usability.

2. Maxillofacial Prosthesis
Combining facial scanners (e.g., 3dMDface) with intraoral scanners (e.g., TRIOS 4) enables precise design of prostheses for patients with facial defects. This method captures both facial topography and fine surface textures, allowing for accurate reproduction using 3D printing—often eliminating the need for manual sculpting.

3. Obstructive Sleep Apnea (OSA)
OSA is a serious condition linked to airway obstruction during sleep. While polysomnography remains the diagnostic gold standard, facial scanners have emerged as a supplementary tool. Algorithms based on 3D facial scans can help predict OSA severity. Additionally, custom CPAP masks designed using facial scan data offer improved comfort and reduced air leakage.

Types of Facial Scanners:

Type	Description	Examples
Phone-based	Handheld apps using smartphone cameras (e.g., TrueDepth)	Bellus3D DentalPro, Qlone
Handheld	Portable scanners moved around the face to build a 3D image	MetiSmile by SHINING 3D
Desktop	Stationary units with multiple cameras and lighting for high-resolution scans	RAYFace, Obi Scanner, VECTRA H2

Abstract

Background

Intraoral scanners have revolutionized the field of dentistry by providing a more efficient, accurate and patient-friendly alternative to traditional dental impressions. This article explore the advancements in intraoral scanning technology and its impact on digital impressions and restorations.

Discussion

It highlights the revolutionary effect these technologies have on modern dentistry, emphasizing the benefits they offer in terms of precision, effectiveness, patient experience, collaboration, integration with CAD/CAM technology and general practice success. The use of intraoral scanners into workflows in dental practices, with a focus on how these devices might improve communication between dental practitioners and laboratories and streamline procedures.

Summary

An intraoral scanner is a digital dental tool that captures precise 3D images of a patient's teeth and gums. It enhances diagnostic accuracy, improves treatment planning, and streamlines workflows, replacing traditional impressions with faster, more comfortable, and efficient scanning methods.

Conclusion

An intraoral scanners has shed light on the significant advancements and benefits that these devices bring to the field of dentistry. By improving accuracy, reducing turnaround times, and enhancing patient comfort, intraoral scanners have revolutionized the way dental professionals capture impressions and collaborate with laboratories.

Keywords: Intraoral scanners, Accuracy, Time efficiency

INTRODUCTION

Intraoral scanners (IOS) have revolutionized prosthodontics by offering a digital alternative to traditional impression techniques. These cutting-edge devices capture highly accurate three-dimensional (3D) images of the oral cavity, streamlining workflows and enhancing patient experience. Unlike conventional impressions, which involve the use of impression materials that can cause discomfort or inaccuracies, IOS provides a non-invasive, precise, and efficient method for creating digital impressions.[1,2]

The integration of intraoral scanning technology into prosthodontics aligns with the broader trend of digitization in dentistry. It has significantly improved the accuracy and efficiency of procedures, including crowns, bridges, veneers, dentures, and implant-supported restorations. Additionally, IOS technology facilitates seamless communication between clinicians, dental laboratories, and CAD/CAM systems, ensuring faster production and improved outcomes for patients.[3]

As the demand for accuracy, efficiency, and patient comfort continues to grow, intraoral scanners are becoming an essential tool in modern prosthodontic practice. Their ability to enhance treatment planning, reduce chair time and improve patient satisfaction marks a paradigm shift in the field, setting new standards for dental care.

MECHANISM

Intraoral scanners function by using a combination of optical and laser technologies to capture detailed 3D images of the oral cavity. As the scanner is moved

Dentulous jaws
Human anatomy

ABSTRACT

Context: Dental surgeons commonly believed that the mandibular site between the mental foramina is the safest for surgical procedures, but there have been numerous reports of significant bleeding accidents in this area. Adequate knowledge about the presence and variation in the morphology of anterior lingual foramina is necessary before starting surgical procedures such as implant placement and ridge augmentation.

Aim: The aim of this study was to analyse the presence, frequency, location and relationship of lingual foramen with the inferior border of mandible on Cone Beam Computed Tomography scans (CBCT).

Settings and design: This retrospective radiographic study was designed and conducted at Maharashtra Institute of Dental Sciences & Research, Latur, India in the Department of Periodontology after approval from the Institutional Ethical Committee.

Materials and methods: 100 CBCT scans of dentulous and partially edentulous mandible were randomly acquired and assessed in coronal, sagittal, transverse and cross-sectional views. The CBCT scans made for diagnostic purposes under field of view 15 × 5 cm, 200 μm voxel size, of patients >20 and < 70 years of age of both the genders were included. Presence of cysts, tumours, systemic diseases affecting bone, fractures, previous surgery in the inter-foraminal region and poor quality of CBCT scans were excluded. Total number of foramina, their location and vertical distance between them to inferior border of mandible were recorded.

Statistical analysis used: Data were entered in data sheets and analysed by using descriptive and inferential statistics. Qualitative data were expressed in terms of proportions while quantitative data were expressed in terms of means and standard deviation. Potential significance was evaluated with Chi square tests.

Result: 100 CBCT scans (47 male and 53 females) were randomly analysed. All participants had at least 1 lingual foramen (LF). Total 172 LF were detected on 100 CBCT scans, including 154 (89.5 %) medial LF (MLF) and 18 lateral LF (LLF) (10.4 %). Out of 154 MLF, 63.6 % were present superior and 36.4 % inferior to genial tubercles. Out of 100 subjects, single LF in 44, two in 43, three in 11, four in 1 and five in 1 patient were observed. 94.44 % **LLF were observed in canine and 1st premolar region. The mean distance from the MLF and inferior border of** mandible was 10.87 ± 2.99 mm, while the same for LLF was 7.1 ± 4.76 mm. About one third of the foramina were in between 13.1 and 16 mm distance from inferior border.

Conclusion: Considering the limitations of the study, the midline lingual foramen can be considered as normal regular anatomic feature with 99 % prevalence while the lateral lingual foramina occur infrequently with a lot of variability in numbers and present commonly in the canine-first premolar zone. Almost 1/3rd of midline foramina are present superior to the genial tubercles.

ABSTRACT

Musculoskeletal diseases (MSDs) are common among Indian dentists and have an impact on their productivity. MSDs are widespread, particularly in the wrist, shoulder, back, and neck, according to a study of 16 research. Vibrating instruments, bad posture, repeated jobs, extended periods of inactivity, and a lack of ergonomic training are among the main concerns.

KEYWORDS: *Dentists, musculoskeletal disorders, risk factors*

INTRODUCTION

Dentistry requires accuracy and long-term posture, but despite advancements in technology, musculoskeletal conditions still impede productivity.[1] Muscles, tendons, the skeleton, cartilage, ligaments, and nerves are all involved in musculoskeletal disorders. These disorder develop slowly over time.[2] The dentists' clinical workload has a strong association with musculoskeletal disorders. Finding risk factors for musculoskeletal problems among Indian dentists was the goal of this study.

MATERIALS AND METHODS

Eligibility criteria

The PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) criteria are adhered to in this review.[3]

Search strategy

We searched PubMed, Cochrane, ProQuest, and LILIACS for studies published between 2000 and 2024, without regard to socioeconomic situation, age, gender, or ethnicity. Suet Yeo Soo (2023) provided the approach [Figure 1]. The following catchphrases were used:

***Abstract*— By facilitating real-time data gathering and evaluation, the Internet of Things' (IoT) incorporation in remote dental health monitoring is transforming preventive oral care. This research investigates a clever method for identifying early indicators of dental problems like cavities, gum disease, and plaque formation using IoT-enabled sensors and machine learning algorithms. A number of ML methods were assessed for computational efficiency, recall, precision, and predictive accuracy, comprising CNN, Random Forest, SVM, and XGBoost. With an AUC-ROC score of 0.98 and a test accuracy of 94.9%, the CNN model performed the best. IoT sensors, such as pressure and imaging sensors, were able to identify oral health issues with an accuracy of over 96%. To maximise IoT efficiency, energy use and false positive rates were also examined. Through ongoing, remote, and AI-assisted diagnostics, outcomes demonstrate how IoT-driven smart monitoring can lower dental dangers and encourage proactive care.**

***Keywords*—IoT, Remote dental health, preventive care**

I. Introduction

The infectious illness known as dental caries is impacted by a number of factors. Even though it may be avoided, it is a serious global public health issue. Dental caries is the most prevalent illness, impacting 560 million primary teeth and 1.3 billion permanent teeth, based to the Global Burden of illness Survey conducted in 2015 [7]. One of the most common noncommunicable illnesses, dental caries affects people of all ages, but especially children, and negatively impacts their general health through inflammatory or nutritional pathways, well-being, social interactions, and economic status [8]. Since it cannot be adequately addressed by a single preventive action, a comprehensive preventative approach [9] is needed. The IoT-based intelligent services are therefore essential in this period of advanced digital technology since they may provide sufficient answers in a management system or service across numerous businesses, involving healthcare.

The term IoT encompasses a broad range of contemporary techniques that have the potential to connect the digital (information) and physical (items) worlds. An early modern network of physically attached objects is known as the IoT.

Users can get information from this network that is linked via the Internet [10] [11]. The WHO defines the IoT as "a system of interconnected computing devices, machines and digital machinery, objects, animals, or people over a network with distinctive identifiers and equipped of transmitting data without the demand for human-to-human or human-to-computer communication." The IoTis seen as an ecosystem that consists of smart devices with sensors, networking, and processing techniques that integrate and cooperate to create an environment where end users may access smart services. The largest new technological development that has sparked an unparalleled information revolution is the IoT. IoT smart devices, of which smartphones are a subset, are crucial to the expansion of IoT devices.There are numerous advantages to using smart devices, including improved communication, increased autonomy, and the ability to share knowledge, all of which can boost productivity [12].

Any smart device that can examine wellbeing information and convey to the Web to complete different telehealth administrations, for example, robotically helped a medical procedure, telemonitoring, matured care oversight, and teleconsultations, is alluded to as the IoT [13] [14]. In spite of the fact that IoT gadgets — most of which are cell phones — share similar portable organization foundation, they utilize unmistakable specialized strategies, complete particular errands, and face unmistakable security threats.Numerous clinical applications, including far off wellbeing checking that could permit carers to notice patients' medical issues continuously and medicine or therapies consistence at home by medical services

Abstract
Dental implants have emerged as a highly reliable and esthetically pleasing modality for the replacement of missing teeth, offering long-term benefits in terms of function, comfort, and preservation of oral structures. Despite their proven clinical success, the decision to undergo implant therapy is significantly influenced by patient perceptions, socio-economic factors, awareness levels, and individual health considerations. This study presents a detailed examination of the acceptance patterns of dental implants among partially edentulous individuals, exploring the demographic and clinical factors associated with their choices. The observational data, derived from a cohort of 325 patients aged 21–80 years, highlights that only 30.4% opted for dental implants, while the majority preferred fixed partial dentures (FPDs) or removable prostheses. Motivators for implant acceptance included improved chewing function, oral health enhancement, esthetics, bone preservation, and durability, whereas deterrents encompassed cost, fear of surgery, systemic health issues, lack of knowledge, and time constraints. Correlation analysis revealed that younger age, higher education, urban residency, and better oral health awareness were positively associated with implant demand, while a higher number of missing teeth negatively correlated with implant selection. This article integrates these findings within the broader global and Indian context, critically analyzing the underlying socio-economic, cultural, and clinical influences on treatment decisions, and proposes strategies to enhance implant acceptance through targeted awareness programs, cost-reduction initiatives, and tailored patient counseling.

Introduction

Tooth loss remains one of the most significant oral health challenges worldwide, impacting not only masticatory efficiency but also speech, facial esthetics, psychological well-being, and overall quality of life. In the Indian context, the prevalence of partial edentulism is notably high, with national estimates indicating that nearly 58.8% of the adult population suffers from the loss of at least one tooth, while 10.7% experience complete edentulism. The burden is disproportionately greater in rural areas, where limited access to dental

Abstract

Background

Intraoral scanners have revolutionized the field of dentistry by providing a more efficient, accurate and patient-friendly alternative to traditional dental impressions. This article explore the advancements in intraoral scanning technology and its impact on digital impressions and restorations.

Discussion

It highlights the revolutionary effect these technologies have on modern dentistry, emphasizing the benefits they offer in terms of precision, effectiveness, patient experience, collaboration, integration with CAD/CAM technology and general practice success. The use of intraoral scanners into workflows in dental practices, with a focus on how these devices might improve communication between dental practitioners and laboratories and streamline procedures.

Summary

An intraoral scanner is a digital dental tool that captures precise 3D images of a patient's teeth and gums. It enhances diagnostic accuracy, improves treatment planning, and streamlines workflows, replacing traditional impressions with faster, more comfortable, and efficient scanning methods.

Conclusion

An intraoral scanners has shed light on the significant advancements and benefits that these devices bring to the field of dentistry. By improving accuracy, reducing turnaround times, and enhancing patient comfort, intraoral scanners have revolutionized the way dental professionals capture impressions and collaborate with laboratories.

Keywords: Intraoral scanners, Accuracy, Time efficiency

INTRODUCTION

Intraoral scanners (IOS) have revolutionized prosthodontics by offering a digital alternative to traditional impression techniques. These cutting-edge devices capture highly accurate three-dimensional (3D) images of the oral cavity, streamlining workflows and enhancing patient experience. Unlike conventional impressions, which involve the use of impression materials that can cause discomfort or inaccuracies, IOS provides a non-invasive, precise, and efficient method for creating digital impressions.[1,2]

The integration of intraoral scanning technology into prosthodontics aligns with the broader trend of digitization in dentistry. It has significantly improved the accuracy and efficiency of procedures, including crowns, bridges, veneers, dentures, and implant-supported restorations. Additionally, IOS technology facilitates seamless communication between clinicians, dental laboratories, and CAD/CAM systems, ensuring faster production and improved outcomes for patients.[3]

As the demand for accuracy, efficiency, and patient comfort continues to grow, intraoral scanners are becoming an essential tool in modern prosthodontic practice. Their ability to enhance treatment planning, reduce chair time and improve patient satisfaction marks a paradigm shift in the field, setting new standards for dental care.

Abstract:
The rapid evolution of digital technologies has significantly transformed dental practices, particularly in prosthetic and aesthetic treatments. While intraoral scanners and CAD/CAM systems are now standard tools, the integration of facial scanners marks a new frontier in digital dentistry. These devices capture detailed 3D representations of the face, offering valuable data for diagnosis, treatment planning, and patient communication.

Keywords: Face-scan, Digital workflow, Digital dentistry, Virtual patient, Scanning technologies

Introduction:
The adoption of CAD/CAM systems in dentistry has streamlined prosthetic workflows and reduced clinical chair time. Tools like intraoral scanners (IOS), cone beam computed tomography (CBCT), and digital photography have enabled clinicians to construct comprehensive virtual models of their patients—commonly referred to as "virtual patients ." One persistent challenge, however, lies in accurately orienting the maxilla in 3D space relative to facial reference lines. Traditional computerized facebow systems, while effective, are often expensive and complex. Facial scanners offer a promising alternative by capturing extraoral structures and integrating them into the digital workflow. Recent developments, including smartphone applications, have made this technology more accessible and user-friendly.

Applications of Facial Scanners:

1. Virtual Patient Records
Facial scanners can digitize extraoral records, replacing analog facebows and diagnostic wax-ups. By merging face scans, intraoral scans, and CBCT data using landmark-based superimposition (e.g., dentition), clinicians can create a 3D virtual patient. This model supports treatment simulation, enhances communication, and facilitates non-invasive documentation.

While current systems struggle to integrate DICOM, STL, and OBJ files into a single platform, researchers like Joda and Gallucci have proposed the development of a 4D virtual patient—incorporating facial movements and virtual articulation data. Techniques such as stereophotogrammetry and reference-point scanning are being explored to improve accuracy and usability.

2. Maxillofacial Prosthesis
Combining facial scanners (e.g., 3dMDface) with intraoral scanners (e.g., TRIOS 4) enables precise design of prostheses for patients with facial defects. This method captures both facial topography and fine surface textures, allowing for accurate reproduction using 3D printing—often eliminating the need for manual sculpting.

3. Obstructive Sleep Apnea (OSA)
OSA is a serious condition linked to airway obstruction during sleep. While polysomnography remains the diagnostic gold standard, facial scanners have emerged as a supplementary tool. Algorithms based on 3D facial scans can help predict OSA severity. Additionally, custom CPAP masks designed using facial scan data offer improved comfort and reduced air leakage.

Types of Facial Scanners:

Type	Description	Examples
Phone-based	Handheld apps using smartphone cameras (e.g., TrueDepth)	Bellus3D DentalPro, Qlone
Handheld	Portable scanners moved around the face to build a 3D image	MetiSmile by SHINING 3D
Desktop	Stationary units with multiple cameras and lighting for high-resolution scans	RAYFace, Obi Scanner, VECTRA H2

***Abstract*— By facilitating real-time data gathering and evaluation, the Internet of Things' (IoT) incorporation in remote dental health monitoring is transforming preventive oral care. This research investigates a clever method for identifying early indicators of dental problems like cavities, gum disease, and plaque formation using IoT-enabled sensors and machine learning algorithms. A number of ML methods were assessed for computational efficiency, recall, precision, and predictive accuracy, comprising CNN, Random Forest, SVM, and XGBoost. With an AUC-ROC score of 0.98 and a test accuracy of 94.9%, the CNN model performed the best. IoT sensors, such as pressure and imaging sensors, were able to identify oral health issues with an accuracy of over 96%. To maximise IoT efficiency, energy use and false positive rates were also examined. Through ongoing, remote, and AI-assisted diagnostics, outcomes demonstrate how IoT-driven smart monitoring can lower dental dangers and encourage proactive care.**

Keywords—IoT, Remote dental health, preventive care

I. INTRODUCTION

The infectious illness known as dental caries is impacted by a number of factors. Even though it may be avoided, it is a serious global public health issue. Dental caries is the most prevalent illness, impacting 560 million primary teeth and 1.3 billion permanent teeth, based to the Global Burden of illness Survey conducted in 2015 [7]. One of the most common noncommunicable illnesses, dental caries affects people of all ages, but especially children, and negatively impacts their general health through inflammatory or nutritional pathways, well-being, social interactions, and economic status [8]. Since it cannot be adequately addressed by a single preventive action, a comprehensive preventative approach [9] is needed. The IoT-based intelligent services are therefore essential in this period of advanced digital technology since they may provide sufficient answers in a management system or service across numerous businesses, involving healthcare.

The term IoT encompasses a broad range of contemporary techniques that have the potential to connect the digital (information) and physical (items) worlds. An early modern network of physically attached objects is known as the IoT.

Users can get information from this network that is linked via the Internet [10] [11]. The WHO defines the IoT as "a system of interconnected computing devices, machines and digital machinery, objects, animals, or people over a network with distinctive identifiers and equipped of transmitting data without the demand for human-to-human or human-to-computer communication." The IoTis seen as an ecosystem that consists of smart devices with sensors, networking, and processing techniques that integrate and cooperate to create an environment where end users may access smart services. The largest new technological development that has sparked an unparalleled information revolution is the IoT. IoT smart devices, of which smartphones are a subset, are crucial to the expansion of IoT devices.There are numerous advantages to using smart devices, including improved communication, increased autonomy, and the ability to share knowledge, all of which can boost productivity [12].

Any smart device that can examine wellbeing information and convey to the Web to complete different telehealth administrations, for example, robotically helped a medical procedure, telemonitoring, matured care oversight, and teleconsultations, is alluded to as the IoT [13] [14]. In spite of the fact that IoT gadgets — most of which are cell phones — share similar portable organization foundation, they utilize unmistakable specialized strategies, complete particular errands, and face unmistakable security threats.Numerous clinical applications, including far off wellbeing checking that could permit carers to notice patients' medical issues continuously and medicine or therapies consistence at home by medical services

Abstract
Dental implants have emerged as a highly reliable and esthetically pleasing modality for the replacement of missing teeth, offering long-term benefits in terms of function, comfort, and preservation of oral structures. Despite their proven clinical success, the decision to undergo implant therapy is significantly influenced by patient perceptions, socio-economic factors, awareness levels, and individual health considerations. This study presents a detailed examination of the acceptance patterns of dental implants among partially edentulous individuals, exploring the demographic and clinical factors associated with their choices. The observational data, derived from a cohort of 325 patients aged 21–80 years, highlights that only 30.4% opted for dental implants, while the majority preferred fixed partial dentures (FPDs) or removable prostheses. Motivators for implant acceptance included improved chewing function, oral health enhancement, esthetics, bone preservation, and durability, whereas deterrents encompassed cost, fear of surgery, systemic health issues, lack of knowledge, and time constraints. Correlation analysis revealed that younger age, higher education, urban residency, and better oral health awareness were positively associated with implant demand, while a higher number of missing teeth negatively correlated with implant selection. This article integrates these findings within the broader global and Indian context, critically analyzing the underlying socio-economic, cultural, and clinical influences on treatment decisions, and proposes strategies to enhance implant acceptance through targeted awareness programs, cost-reduction initiatives, and tailored patient counseling.

Introduction

Tooth loss remains one of the most significant oral health challenges worldwide, impacting not only masticatory efficiency but also speech, facial esthetics, psychological well-being, and overall quality of life. In the Indian context, the prevalence of partial edentulism is notably high, with national estimates indicating that nearly 58.8% of the adult population suffers from the loss of at least one tooth, while 10.7% experience complete edentulism. The burden is disproportionately greater in rural areas, where limited access to dental

Abstract

Background

Intraoral scanners have revolutionized the field of dentistry by providing a more efficient, accurate and patient-friendly alternative to traditional dental impressions. This article explore the advancements in intraoral scanning technology and its impact on digital impressions and restorations.

Discussion

It highlights the revolutionary effect these technologies have on modern dentistry, emphasizing the benefits they offer in terms of precision, effectiveness, patient experience, collaboration, integration with CAD/CAM technology and general practice success. The use of intraoral scanners into workflows in dental practices, with a focus on how these devices might improve communication between dental practitioners and laboratories and streamline procedures.

Summary

An intraoral scanner is a digital dental tool that captures precise 3D images of a patient's teeth and gums. It enhances diagnostic accuracy, improves treatment planning, and streamlines workflows, replacing traditional impressions with faster, more comfortable, and efficient scanning methods.

Conclusion

An intraoral scanners has shed light on the significant advancements and benefits that these devices bring to the field of dentistry. By improving accuracy, reducing turnaround times, and enhancing patient comfort, intraoral scanners have revolutionized the way dental professionals capture impressions and collaborate with laboratories.

Keywords: Intraoral scanners, Accuracy, Time efficiency

INTRODUCTION

Intraoral scanners (IOS) have revolutionized prosthodontics by offering a digital alternative to traditional impression techniques. These cutting-edge devices capture highly accurate three-dimensional (3D) images of the oral cavity, streamlining workflows and enhancing patient experience. Unlike conventional impressions, which involve the use of impression materials that can cause discomfort or inaccuracies, IOS provides a non-invasive, precise, and efficient method for creating digital impressions.[1,2]

The integration of intraoral scanning technology into prosthodontics aligns with the broader trend of digitization in dentistry. It has significantly improved the accuracy and efficiency of procedures, including crowns, bridges, veneers, dentures, and implant-supported restorations. Additionally, IOS technology facilitates seamless communication between clinicians, dental laboratories, and CAD/CAM systems, ensuring faster production and improved outcomes for patients.[3]

As the demand for accuracy, efficiency, and patient comfort continues to grow, intraoral scanners are becoming an essential tool in modern prosthodontic practice. Their ability to enhance treatment planning, reduce chair time and improve patient satisfaction marks a paradigm shift in the field, setting new standards for dental care.

MECHANISM

Intraoral scanners function by using a combination of optical and laser technologies to capture detailed 3D images of the oral cavity. As the scanner is moved

Abstract:
The rapid evolution of digital technologies has significantly transformed dental practices, particularly in prosthetic and aesthetic treatments. While intraoral scanners and CAD/CAM systems are now standard tools, the integration of facial scanners marks a new frontier in digital dentistry. These devices capture detailed 3D representations of the face, offering valuable data for diagnosis, treatment planning, and patient communication.

Keywords: Face-scan, Digital workflow, Digital dentistry, Virtual patient, Scanning technologies

Introduction:

The adoption of CAD/CAM systems in dentistry has streamlined prosthetic workflows and reduced clinical chair time. Tools like intraoral scanners (IOS), cone beam computed tomography (CBCT), and digital photography have enabled clinicians to construct comprehensive virtual models of their patients—commonly referred to as "virtual patients ." One persistent challenge, however, lies in accurately orienting the maxilla in 3D space relative to facial reference lines. Traditional computerized facebow systems, while effective, are often expensive and complex. Facial scanners offer a promising alternative by capturing extraoral structures and integrating them into the digital workflow. Recent developments, including smartphone applications, have made this technology more accessible and user-friendly.

Applications of Facial Scanners:

1. Virtual Patient Records

Facial scanners can digitize extraoral records, replacing analog facebows and diagnostic wax-ups. By merging face scans, intraoral scans, and CBCT data using landmark-based superimposition (e.g., dentition), clinicians can create a 3D virtual patient. This model supports treatment simulation, enhances communication, and facilitates non-invasive documentation.

While current systems struggle to integrate DICOM, STL, and OBJ files into a single platform, researchers like Joda and Gallucci have proposed the development of a 4D virtual patient—incorporating facial movements and virtual articulation data. Techniques such as stereophotogrammetry and reference-point scanning are being explored to improve accuracy and usability.

2. Maxillofacial Prosthesis

Combining facial scanners (e.g., 3dMDface) with intraoral scanners (e.g., TRIOS 4) enables precise design of prostheses for patients with facial defects. This method captures both facial topography and fine surface textures, allowing for accurate reproduction using 3D printing—often eliminating the need for manual sculpting.

3. Obstructive Sleep Apnea (OSA)

OSA is a serious condition linked to airway obstruction during sleep. While polysomnography remains the diagnostic gold standard, facial scanners have emerged as a supplementary tool. Algorithms based on 3D facial scans can help predict OSA severity. Additionally, custom CPAP masks designed using facial scan data offer improved comfort and reduced air leakage.

Types of Facial Scanners:

Type	Description	Examples

Abstract

Introduction: *Scientific research is fundamental to advancing healthcare quality and dental practice. This study aimed to assess the knowledge, attitude, practices, and barriers related to scientific research among undergraduate dental students in the Marathwada region.*

Methods: *A cross-sectional, web-based questionnaire survey was conducted among third-year, final-year BDS students, and interns. The survey comprised sections on demographics, knowledge, general and personal attitudes, practices, and barriers toward research. Data were analysed using descriptive statistics.*

Results: *A total of 552 students participated, with 77.9% females. Correct knowledge of research objectives was low (16%), though awareness of null hypothesis (60.1%) and double-blind trials (58%) was better. Positive attitudes were predominant, with 65.2% supporting inclusion of research methodology in the curriculum and 70% interested in research workshops. However, research practice was limited; only 20.4% attended research courses, and 12.1% had publications. The primary barrier identified was lack of time (around 50%).*

Conclusion: *Undergraduate dental students in the Marathwada region possess a foundational understanding and positive attitude toward scientific research but engage less in active research practices. Incorporating research training into the dental curriculum and providing structured opportunities could enhance student participation and foster research competency.*

Keywords *– Knowledge, Attitude, Research, Cross sectional survey, Students, Dental, Dentistry.*

INTRODUCTION

In accordance with the Common Rule and the Privacy Rule of the Health Insurance Portability and Accountability Act (HIPAA), "research" is described as "a systematic investigation, including research development, testing, and evaluation, designed to develop or contribute to generalizable knowledge."[1] The scientific study known as "health care service research" is a multidisciplinary field that looks at how various factors

Abstract
Objectives: *Aim of this in-vitro study was to evaluate the pushout bond strength of a glass fiber post to dentin pretreated with 6.5% proanthocyanidine, 5% glutaraldehyde and 10% sodium ascorbate.*
Materials and Methods: *Thirty-two single rooted human premolar teeth, extracted for orthodontic or periodontal reasons were decoronated at cementoenamel junction to a length of 14 mm. Root canals were prepared using rotary NiTi files and obturated with gutta percha and resin sealer. Post space was prepared using peeso reamers, retaining 5 mm gutta percha at apex. The smear layer was removed using 5 ml of 17% EDTA and the post space was etched with 37% phosphoric acid. The samples were randomly assigned to four groups (n=8) based on the pretreatment of root canal dentine: Group 1: Control (No Pretreatment), Group 2: 6.5% Proanthocyanidin, Group 3: 5% Glutaraldehyde and Group 4: 10% Sodium Ascorbate. A glass fiber post was luted using a dual cure adhesive and luting cement. 1 mm thick root slices were sectioned from coronal, middle and apical levels. The immediate (24 hrs) and delayed by aging the specimen with 10% sodium hypochlorite (6 months) push-out bond strength of the glass fibre post to the root dentine were measured using a universal testing machine at a crosshead speed of 0.5 mm/min until the fibre post dislodged.*
Statistical analysis: *Data was analyzed using One-way ANOVA Test & Post-hoc Tukey`s test ($P<0.05$).*
Results: *There was significant difference in the groups containing 6.5% Proanthocyanidin, 5% Glutaraldehyde and 10% Sodium ascorbate; where 10% Sodium ascorbate shows significantly higher immediate (24 hours) and delayed (6 months) pushout bond strength followed by 6.5% Proanthocyanidin (PAC) and 5% Glutaraldehyde.*
Conclusion: *Among the experimental group, 10% Sodium Ascorbate showed higher immediate as well as delayed pushout bond strength followed by 6.5% Proanthocyanidin and 5% Glutaraldehyde.*
Keywords: *pushout bond strength, glass fiber post, sodium ascorbate, proanthocyanidin, glutaraldehyde.*

Abstract
Introduction: The objective of this in vitro study was to examine flexural strength of human radicular dentin sticks after conditioning with four different endodontic chelating agent. Materials and Methods: Forty dentin sticks of (1 mm × 1 mm × 12 mm) were obtained from 10 single-rooted premolars and divided into four groups (n = 10). One stick from each tooth was assigned to one of the experimental groups and was soaked in one of the experimental chelating solutions for 5 min 17% Ethylenediaminetetraacetic acid (EDTA), 0.2% Chitosan (C), 10% Citric Acid (CA) plus 2% Chlorhexidine (CHX), or Saline (control group). Following the 5-min soak, the sticks' flexural strength was evaluated using a 3-point loading test using the universal testing machine. Results: Chitosan (0.2%) and Citric acid (10%) plus Chlorhexidine (2%) showed no significant detrimental effect on the flexural strength radicular dentin compared to the control. EDTA (17%) exhibited a significant drop in the flexural strength and microhardness of radicular dentin compared to the other groups. Conclusions: Chitosan and Citric Acid plus Chlorhexidine chelators do not compromise the surface and bulk mechanical properties of radicular dentin.

Keywords: *Ethylenediaminetetraacetic acid; Chitosan; Citric acid; Chlorhexidine; flexural strength*

Abstract
Objectives: *Aim of this in-vitro study was to evaluate the pushout bond strength of a glass fiber post to dentin pretreated with 6.5% proanthocyanidine, 5% glutaraldehyde and 10% sodium ascorbate.*
Materials and Methods: *Thirty-two single rooted human premolar teeth, extracted for orthodontic or periodontal reasons were decoronated at cementoenamel junction to a length of 14 mm. Root canals were prepared using rotary NiTi files and obturated with gutta percha and resin sealer. Post space was prepared using peeso reamers, retaining 5 mm gutta percha at apex. The smear layer was removed using 5 ml of 17% EDTA and the post space was etched with 37% phosphoric acid. The samples were randomly assigned to four groups (n=8) based on the pretreatment of root canal dentine: Group 1: Control (No Pretreatment), Group 2: 6.5% Proanthocyanidin, Group 3: 5% Glutaraldehyde and Group 4: 10% Sodium Ascorbate. A glass fiber post was luted using a dual cure adhesive and luting cement. 1 mm thick root slices were sectioned from coronal, middle and apical levels. The immediate (24 hrs) and delayed by aging the specimen with 10% sodium hypochlorite (6 months) push-out bond strength of the glass fibre post to the root dentine were measured using a universal testing machine at a crosshead speed of 0.5 mm/min until the fibre post dislodged.*
Statistical analysis: *Data was analyzed using One-way ANOVA Test & Post-hoc Tukey`s test ($P<0.05$).*
Results: *There was significant difference in the groups containing 6.5% Proanthocyanidin, 5% Glutaraldehyde and 10% Sodium ascorbate; where 10% Sodium ascorbate shows significantly higher immediate (24 hours) and delayed (6 months) pushout bond strength followed by 6.5% Proanthocyanidin (PAC) and 5% Glutaraldehyde.*
Conclusion: *Among the experimental group, 10% Sodium Ascorbate showed higher immediate as well as delayed pushout bond strength followed by 6.5% Proanthocyanidin and 5% Glutaraldehyde.*
Keywords: *pushout bond strength, glass fiber post, sodium ascorbate, proanthocyanidin, glutaraldehyde.*

Abstract:
Objectives: *Aim of this in vitro study was to evaluate and compare the effect of three different remineralizing dentifrices on surface microhardness of artificially demineralized human enamel.*
Materials and Methods: *Artificial white spot lesions were created in enamel blocks obtained from thirty sound human molars. Specimens were then randomly divided into three groups (n = 10) based on the test dentifrice used, Group 1:* Colgate Sensitive Plus toothpaste, *Group 2:* Aclaim toothpaste and Group 3: SHY-XT toothpaste. Samples were subjected to *Vickers microhardness testing.*
Statistical Analysis: *One-way ANOVA and post hoc Tukey's test were applied for intergroup comparisons. A p-value < 0.05 was considered statistically significant.*
Results: *All three dentifrices showed significant remineralization (p < 0.001). SHY-XT exhibited the highest post-treatment hardness, followed by Aclaim and Colgate Sensitive Plus.*
Conclusion: *SHY-XT was most effective due to its combined fluoride and nHAp content. Biomimetic agents like Aclaim also demonstrated promising results.*
Keywords: *Remineralization, white spot lesions, nano-hydroxyapatite, fluoride, dentifrices, surface microhardness, in-vitro.*

Abstract:

Background: This article aims to review the SNPs applications in nanomaterial and nano formulations in restorative dentistry, discussing their effect on physicochemical properties, biocompatibility and ability to nano carry bioactive substances.

Review Findings: The addition of SNPs in Polymethyl Methacrylate increases microhardness, fracture toughness and decreases Candida Albicans adhesion. Polymerization shrinkage decreased when SNPs were added in composite resin with increase flexural strength, flexural modulus, wear resistance. GIC cement having limitations of microleakage was overcome with the help of incorporation of HTCC-MSN & Nano Zro2-Sio2-HA. Incorporating SNPs into bioactive glasses showed tissue remineralization potential. Experimental adhesives with higher concentration of particles for bonding lowered risk to dental enamel during bracket detachment & reduced friction between tooth and bracket.

Conclusion: SNPs incorporation improved the biological and physiochemical and mechanical properties of dental materials & over-ruled the drawbacks of previous dental material. Different studies in this review concluded that SNPs of smaller sizes particularly ranging between 78nm and 424 nm provided the advantage of being biocompatible and non- cytotoxic.1

Abstract
Objectives: *Aim of this in-vitro study was to evaluate the pushout bond strength of a glass fiber post to dentin pretreated with 6.5% proanthocyanidine, 5% glutaraldehyde and 10% sodium ascorbate.*
Materials and Methods: *Thirty-two single rooted human premolar teeth, extracted for orthodontic or periodontal reasons were decoronated at cementoenamel junction to a length of 14 mm. Root canals were prepared using rotary NiTi files and obturated with gutta percha and resin sealer. Post space was prepared using peeso reamers, retaining 5 mm gutta percha at apex. The smear layer was removed using 5 ml of 17% EDTA and the post space was etched with 37% phosphoric acid. The samples were randomly assigned to four groups (n=8) based on the pretreatment of root canal dentine: Group 1: Control (No Pretreatment), Group 2: 6.5% Proanthocyanidin, Group 3: 5% Glutaraldehyde and Group 4: 10% Sodium Ascorbate. A glass fiber post was luted using a dual cure adhesive and luting cement. 1 mm thick root slices were sectioned from coronal, middle and apical levels. The immediate (24 hrs) and delayed by aging the specimen with 10% sodium hypochlorite (6 months) push-out bond strength of the glass fibre post to the root dentine were measured using a universal testing machine at a crosshead speed of 0.5 mm/min until the fibre post dislodged.*
Statistical analysis: *Data was analyzed using One-way ANOVA Test & Post-hoc Tukey`s test ($P<0.05$).*
Results: *There was significant difference in the groups containing 6.5% Proanthocyanidin, 5% Glutaraldehyde and 10% Sodium ascorbate; where 10% Sodium ascorbate shows significantly higher immediate (24 hours) and delayed (6 months) pushout bond strength followed by 6.5% Proanthocyanidin (PAC) and 5% Glutaraldehyde.*
Conclusion: *Among the experimental group, 10% Sodium Ascorbate showed higher immediate as well as delayed pushout bond strength followed by 6.5% Proanthocyanidin and 5% Glutaraldehyde.*
Keywords: *pushout bond strength, glass fiber post, sodium ascorbate, proanthocyanidin, glutaraldehyde.*

Abstract:
Objectives: *Aim of this in vitro study was to evaluate and compare the effect of three different remineralizing dentifrices on surface microhardness of artificially demineralized human enamel.*
Materials and Methods: *Artificial white spot lesions were created in enamel blocks obtained from thirty sound human molars. Specimens were then randomly divided into three groups (n = 10) based on the test dentifrice used, Group 1:* Colgate Sensitive Plus toothpaste, *Group 2:* Aclaim toothpaste and Group 3: SHY-XT toothpaste. Samples were subjected to *Vickers microhardness testing.*
Statistical Analysis: *One-way ANOVA and post hoc Tukey's test were applied for intergroup comparisons. A p-value < 0.05 was considered statistically significant.*
Results: *All three dentifrices showed significant remineralization (p < 0.001). SHY-XT exhibited the highest post-treatment hardness, followed by Aclaim and Colgate Sensitive Plus.*
Conclusion: *SHY-XT was most effective due to its combined fluoride and nHAp content. Biomimetic agents like Aclaim also demonstrated promising results.*
Keywords: *Remineralization, white spot lesions, nano-hydroxyapatite, fluoride, dentifrices, surface microhardness, in-vitro.*

Abstract
Introduction: The objective of this in vitro study was to examine flexural strength of human radicular dentin sticks after conditioning with four different endodontic chelating agent. Materials and Methods: Forty dentin sticks of (1 mm × 1 mm × 12 mm) were obtained from 10 single-rooted premolars and divided into four groups (n = 10). One stick from each tooth was assigned to one of the experimental groups and was soaked in one of the experimental chelating solutions for 5 min 17% Ethylenediaminetetraacetic acid (EDTA), 0.2% Chitosan (C), 10% Citric Acid (CA) plus 2% Chlorhexidine (CHX), or Saline (control group). Following the 5-min soak, the sticks' flexural strength was evaluated using a 3-point loading test using the universal testing machine. Results: Chitosan (0.2%) and Citric acid (10%) plus Chlorhexidine (2%) showed no significant detrimental effect on the flexural strength radicular dentin compared to the control. EDTA (17%) exhibited a significant drop in the flexural strength and microhardness of radicular dentin compared to the other groups. Conclusions: Chitosan and Citric Acid plus Chlorhexidine chelators do not compromise the surface and bulk mechanical properties of radicular dentin.

Keywords: *Ethylenediaminetetraacetic acid; Chitosan; Citric acid; Chlorhexidine; flexural strength*

I. Introduction

Chelating agents decalcify radicular dentin and eliminate the smear layer formed after the mechanical preparation of the root canal.[1] The smear layer acts as a barrier that precludes irrigants from directly reaching and disinfecting the dentin surface[2], the dentinal tubules, and altering the sealing quality of obturation.[3,4]

Chelating agents, such as Ethylenediaminetetraacetic acid (EDTA), is used as a gold standard strong chelator with proven smear layer removal capacity.[5,6] Since the smear layer contains both inorganic and organic

Abstract

Introduction Pterygoid implants offer a reliable alternative for rehabilitating the atrophic posterior maxilla by avoiding complex grafting procedures. Despite their increasing use, there is no standardized framework for assessing their clinical success. This study introduces the Pterygoid Implant Placement Success Index (PIPSI), a comprehensive scoring system to evaluate pterygoid implants across preoperative, intraoperative, and postoperative parameters.

Materials and Methods PIPSI was developed using eight critical parameters: bone density, implant length, angulation accuracy, primary stability, loading protocol, bone resorption, postoperative complications, and prosthetic success. Each parameter was weighted based on clinical relevance, culminating in a total score of 80. Scores were stratified into four outcome categories: Excellent (70–80), Good (55–69), Moderate (40–54), and Poor (<40). Validation involved inter-observer reliability, internal consistency (Cronbach's alpha), and predictive validity using logistic regression and ROC curve analysis.

Results PIPSI scores demonstrated strong internal consistency and significant correlation with implant survival and prosthetic outcomes. Higher scores were associated with fewer complications and better long-term stability. Stratification revealed distinct survival curves across outcome groups, confirmed by Kaplan–Meier analysis and log-rank testing ($p<0.05$). ROC analysis yielded high discriminative accuracy for predicting implant success.

Discussion The PIPSI offers a robust, objective method for assessing pterygoid implant success, integrating anatomical, surgical, and prosthetic dimensions. It facilitates clinical decision-making and standardized reporting. Limitations include the need for prospective validation, standardization of imaging metrics, and incorporation of patient-reported outcomes. Future enhancements may include digital integration and AI-driven predictive modelling.

Keywords Pterygoid implants · Posterior maxilla rehabilitation · Implant success index · Osseointegration

ABSTRACT

Musculoskeletal diseases (MSDs) are common among Indian dentists and have an impact on their productivity. MSDs are widespread, particularly in the wrist, shoulder, back, and neck, according to a study of 16 research. Vibrating instruments, bad posture, repeated jobs, extended periods of inactivity, and a lack of ergonomic training are among the main concerns.

KEYWORDS: *Dentists, musculoskeletal disorders, risk factors*

INTRODUCTION

Dentistry requires accuracy and long-term posture, but despite advancements in technology, musculoskeletal conditions still impede productivity.[1] Muscles, tendons, the skeleton, cartilage, ligaments, and nerves are all involved in musculoskeletal disorders. These disorder develop slowly over time.[2] The dentists' clinical workload has a strong association with musculoskeletal disorders. Finding risk factors for musculoskeletal problems among Indian dentists was the goal of this study.

MATERIALS AND METHODS

Eligibility criteria

The PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) criteria are adhered to in this review.[3]

Search strategy

We searched PubMed, Cochrane, ProQuest, and LILIACS for studies published between 2000 and 2024, without regard to socioeconomic situation, age, gender, or ethnicity. Suet Yeo Soo (2023) provided the approach [Figure 1]. The following catchphrases were used:

Abstract

Introduction: Periodontitis, a chronic inflammatory disease caused by polymicrobial biofilms, leads to tissue destruction, tooth loss and systemic health implications. Conventional therapies such as chlorhexidine have limitations, prompting a search for safer alternatives. Plant-derived agents, specifically *Psidium guajava* (guava) and *Glycyrrhiza glabra* (mulethi), are promising due to their antimicrobial, anti-inflammatory and antioxidant properties. This study aimed to compare the clinical efficacy of guava and mulethi extracts in periodontal therapy. **Materials and Methods:** A 9-month randomised controlled trial included sixty Localised Aggressive Periodontitis patients (18–50 years). After ethical clearance and consent, patients were diagnosed based on clinical and radiographic signs. Participants were randomised into two groups ($n = 30$ each): Group A (Mulethi gel) and Group B (Guava leaf extract). Gels were applied twice daily for 6 months, alongside standard oral hygiene. Clinical indices, in Plaque Index, Gingival Index and Probing Pocket Depth were assessed at baseline, 3 and 6 months by a blinded evaluator. Data were analysed using SPSS version 20; paired and independent *t*-tests with $P < 0.05$. **Results:** Both extracts significantly improved periodontal parameters and showed strong antibacterial activity against *Porphyromonas gingivalis* and *Aggregatibacter actinomycetemcomitans* ($P < 0.0001$). Guava improved the mean zone of inhibition for *P. gingivalis* from 8.65 mm to 10.2 mm and for *A. actinomycetemcomitans* from 20.36 mm to 23.08 mm. Mulethi showed an increase from 9.87 mm to 11.23 mm for *P. gingivalis*, and from 23.11 mm to 25.07 mm for *A. actinomycetemcomitans*. **Conclusion:** Mulethi and Guava leaf extracts significantly improved gingival health and demonstrated strong antibacterial activity against key periodontal pathogens. These findings highlight their potential as effective, biocompatible alternatives in periodontal therapy, offering comparable benefits to conventional treatments with fewer side effects.

Keywords: Antimicrobial activity, *Glycyrrhiza glabra*, guava leaf extract, herbal gel, localised aggressive periodontitis, mulethi, periodontal therapy, *Psidium guajava*

Introduction

Periodontitis is a widespread and ongoing inflammatory disease primarily caused by a complex polymicrobial biofilm that adheres to tooth surfaces.[1,2] This microbial challenge triggers a host immune-inflammatory response, characterised by the release of pro-inflammatory cytokines, reactive oxygen species and other mediators, ultimately leading to the destruction of both soft and hard periodontal tissues.[3,4] If not addressed, periodontitis can result in progressive attachment loss, tooth mobility,[5] and eventual tooth loss. Furthermore, its impact is not limited to the oral cavity, as it has been linked to systemic conditions such as diabetes mellitus, cardiovascular disease and adverse pregnancy outcomes [Figure 1 and Table 1].[6-8]

Despite advances in periodontal therapy, conventional treatments – including oral hygiene education, scaling and root

Abstract

Introduction: *Scientific research is fundamental to advancing healthcare quality and dental practice. This study aimed to assess the knowledge, attitude, practices, and barriers related to scientific research among undergraduate dental students in the Marathwada region.*

Methods: *A cross-sectional, web-based questionnaire survey was conducted among third-year, final-year BDS students, and interns. The survey comprised sections on demographics, knowledge, general and personal attitudes, practices, and barriers toward research. Data were analysed using descriptive statistics.*

Results: *A total of 552 students participated, with 77.9% females. Correct knowledge of research objectives was low (16%), though awareness of null hypothesis (60.1%) and double-blind trials (58%) was better. Positive attitudes were predominant, with 65.2% supporting inclusion of research methodology in the curriculum and 70% interested in research workshops. However, research practice was limited; only 20.4% attended research courses, and 12.1% had publications. The primary barrier identified was lack of time (around 50%).*

Conclusion: *Undergraduate dental students in the Marathwada region possess a foundational understanding and positive attitude toward scientific research but engage less in active research practices. Incorporating research training into the dental curriculum and providing structured opportunities could enhance student participation and foster research competency.*

Keywords *– Knowledge, Attitude, Research, Cross sectional survey, Students, Dental, Dentistry.*

Abstract

Introduction: Localised aggressive periodontitis (LAP) is a rapidly progressive form of periodontitis affecting systemically healthy adolescents and young adults. Herbal agents such as *Glycyrrhiza glabra* (mulethi) and *Psidium guajava* (guava) are known for their antimicrobial and anti-inflammatory properties. This study aims to evaluate and compare the antimicrobial efficacy of mulethi and guava leaf extract gels against key periodontal pathogens in LAP. **Materials and Methods:** A randomised controlled trial involving 60 patients aged 18–50 years with clinically diagnosed LAP was conducted at VYWS Dental College, Amravati. Participants were randomly divided into two groups: Group A received mulethi extract gel, and Group B received guava leaf extract gel. The antimicrobial activity of both gels was assessed *in vitro* using the agar well diffusion method against *Aggregatibacter actinomycetemcomitans* and *Porphyromonas gingivalis*. Zones of inhibition were measured at baseline, 3 months and 6 months. Data were statistically analysed using ANOVA and *t*-tests, with $P < 0.05$ considered statistically significant. **Results:** Both herbal gels demonstrated statistically significant antimicrobial activity against *P. gingivalis* and *A. actinomycetemcomitans* over time ($P < 0.0001$). Mulethi extract gel showed consistently superior antibacterial effects at all time intervals. At 6 months, the zone of inhibition for *P. gingivalis* was 11.23 ± 0.70 mm in Group A versus 10.2 ± 0.52 mm in Group B; for *A. actinomycetemcomitans*, it was 25.07 ± 0.96 mm versus 23.08 ± 0.91 mm, respectively. **Conclusion:** Mulethi extract gel revealed significantly higher antimicrobial efficacy compared to guava leaf extract gel in managing localised aggressive periodontitis.

Keywords: Antimicrobial efficacy, *Glycyrrhiza glabra*, herbal gel, localised aggressive periodontitis, periodontal pathogens, *Psidium guajava*

Introduction

Localised aggressive periodontitis (LAP) is a severe dental infection characterised by rapid attachment loss and bone destruction.[1,2] It typically affects systemically healthy adolescents and is distinguished by its early onset and familial aggregation.[3,4] Moreover, it is associated with a specific microbial profile, including *Aggregatibacter actinomycetemcomitans* and *Porphyromonas gingivalis*.

In dentistry, the conventional management of LAP relies primarily on mechanical debridement combined with systemic antibiotics.[5,6] However, growing concerns about antimicrobial resistance, adverse effects and the indiscriminate use of antibiotics have prompted a global call for alternative therapeutic strategies.

In low- and middle-income countries (LMICs), limited access to standardised dental care and the high prevalence of periodontal diseases present a significant public health challenge. A cross-sectional study conducted in Hyderabad reported that while chronic periodontitis affected 90.35% of cases, aggressive periodontitis both localised and generalised was observed in 9.64% of cases.[7] Furthermore, a robust evidence-based systematic review and meta-analysis by

ABSTRACT

Context: Dental surgeons commonly believed that the mandibular site between the mental foramina is the safest for surgical procedures, but there have been numerous reports of significant bleeding accidents in this area. Adequate knowledge about the presence and variation in the morphology of anterior lingual foramina is necessary before starting surgical procedures such as implant placement and ridge augmentation.

Aim: The aim of this study was to analyse the presence, frequency, location and relationship of lingual foramen with the inferior border of mandible on Cone Beam Computed Tomography scans (CBCT).

Settings and design: This retrospective radiographic study was designed and conducted at Maharashtra Institute of Dental Sciences & Research, Latur, India in the Department of Periodontology after approval from the Institutional Ethical Committee.

Materials and methods: 100 CBCT scans of dentulous and partially edentulous mandible were randomly acquired and assessed in coronal, sagittal, transverse and cross-sectional views. The CBCT scans made for diagnostic purposes under field of view 15 × 5 cm, 200 μm voxel size, of patients >20 and < 70 years of age of both the genders were included. Presence of cysts, tumours, systemic diseases affecting bone, fractures, previous surgery in the inter-foraminal region and poor quality of CBCT scans were excluded. Total number of foramina, their location and vertical distance between them to inferior border of mandible were recorded.

Statistical analysis used: Data were entered in data sheets and analysed by using descriptive and inferential statistics. Qualitative data were expressed in terms of proportions while quantitative data were expressed in terms of means and standard deviation. Potential significance was evaluated with Chi square tests.

Result: 100 CBCT scans (47 male and 53 females) were randomly analysed. All participants had at least 1 lingual foramen (LF). Total 172 LF were detected on 100 CBCT scans, including 154 (89.5 %) medial LF (MLF) and 18 lateral LF (LLF) (10.4 %). Out of 154 MLF, 63.6 % were present superior and 36.4 % inferior to genial tubercles. Out of 100 subjects, single LF in 44, two in 43, three in 11, four in 1 and five in 1 patient were observed. 94.44 % LLF were observed in canine and 1st premolar region. The mean distance from the MLF and inferior border of mandible was 10.87 ± 2.99 mm, while the same for LLF was 7.1 ± 4.76 mm. About one third of the foramina were in between 13.1 and 16 mm distance from inferior border.

Conclusion: Considering the limitations of the study, the midline lingual foramen can be considered as normal regular anatomic feature with 99 % prevalence while the lateral lingual foramina occur infrequently with a lot of variability in numbers and present commonly in the canine-first premolar zone. Almost 1/3rd of midline foramina are present superior to the genial tubercles.

ABSTRACT

Hemisection is a conservative dental procedure involving the removal or separation of one root and its associated portion of the crown. This treatment is particularly appropriate when pathologies such as caries, resorption, perforation, or periodontal damage are confined to a single root, while the other root remains healthy and functional. By preserving the unaffected root and surrounding alveolar bone, hemisection not only aids in maintaining tooth structure but also creates favourable conditions for future prosthetic rehabilitation, including the placement of fixed dental prostheses. This paper presents two clinical cases treated with hemisection: one involving endodontic failure and the other characterized by periodontal involvement of a single tooth.

Keywords: Hemisection, Root resection, Mandibular molar, Furcation involvement

INTRODUCTION

Modern dentistry focuses on conserving and preserving natural teeth, to ensure that functional dentition is maintained throughout the life. However, proper periodontal, prosthetic, and endodontic evaluations are essential to ensure the appropriate selection of treatment cases.[1] The loss of posterior teeth can result in tooth migration, diminished masticatory function, and a reduction in arch length. Therefore, preserving posterior teeth is essential for maintaining oral health and functionality.[2]

Treating molars with severe decay and compromised periodontal health posed significant challenges, often leaving extraction and replacement as the only options.[3] Root resective therapies are an effective treatment option for preserving natural tooth structure and can provide patients with a viable alternative. With proper execution and good oral hygiene, root resective therapy can achieve a high success rate.[4]

Hemisection involves the sectioning of a molar when one of its roots has suffered irreversible damage due to factors such as carious lesions, endodontic infections, or periodontal disease, which is subsequently removed. This procedure is primarily performed on mandibular molars. The decision to retain a root depends on factors such as the extent and pattern of bone loss, root trunk and length, the ability to eliminate the osseous defect, and endodontic and restorative considerations. Hemisection helps to retain tooth structure and surrounding alveolar bone while also facilitating the placement of a fixed prosthesis.[5]

***Abstract*— By facilitating real-time data gathering and evaluation, the Internet of Things' (IoT) incorporation in remote dental health monitoring is transforming preventive oral care. This research investigates a clever method for identifying early indicators of dental problems like cavities, gum disease, and plaque formation using IoT-enabled sensors and machine learning algorithms. A number of ML methods were assessed for computational efficiency, recall, precision, and predictive accuracy, comprising CNN, Random Forest, SVM, and XGBoost. With an AUC-ROC score of 0.98 and a test accuracy of 94.9%, the CNN model performed the best. IoT sensors, such as pressure and imaging sensors, were able to identify oral health issues with an accuracy of over 96%. To maximise IoT efficiency, energy use and false positive rates were also examined. Through ongoing, remote, and AI-assisted diagnostics, outcomes demonstrate how IoT-driven smart monitoring can lower dental dangers and encourage proactive care.**

Keywords—IoT, Remote dental health, preventive care

I. INTRODUCTION

The infectious illness known as dental caries is impacted by a number of factors. Even though it may be avoided, it is a serious global public health issue. Dental caries is the most prevalent illness, impacting 560 million primary teeth and 1.3 billion permanent teeth, based to the Global Burden of illness Survey conducted in 2015 [7]. One of the most common noncommunicable illnesses, dental caries affects people of all ages, but especially children, and negatively impacts their general health through inflammatory or nutritional pathways, well-being, social interactions, and economic status [8]. Since it cannot be adequately addressed by a single preventive action, a comprehensive preventative approach [9] is needed. The IoT-based intelligent services are therefore essential in this period of advanced digital technology since they may provide sufficient answers in a management system or service across numerous businesses, involving healthcare.

The term IoT encompasses a broad range of contemporary techniques that have the potential to connect the digital (information) and physical (items) worlds. An early modern network of physically attached objects is known as the IoT.

Users can get information from this network that is linked via the Internet [10] [11]. The WHO defines the IoT as "a system of interconnected computing devices, machines and digital machinery, objects, animals, or people over a network with distinctive identifiers and equipped of transmitting data without the demand for human-to-human or human-to-computer communication." The IoTis seen as an ecosystem that consists of smart devices with sensors, networking, and processing techniques that integrate and cooperate to create an environment where end users may access smart services. The largest new technological development that has sparked an unparalleled information revolution is the IoT. IoT smart devices, of which smartphones are a subset, are crucial to the expansion of IoT devices.There are numerous advantages to using smart devices, including improved communication, increased autonomy, and the ability to share knowledge, all of which can boost productivity [12].

Any smart device that can examine wellbeing information and convey to the Web to complete different telehealth administrations, for example, robotically helped a medical procedure, telemonitoring, matured care oversight, and teleconsultations, is alluded to as the IoT [13] [14]. In spite of the fact that IoT gadgets — most of which are cell phones — share similar portable organization foundation, they utilize unmistakable specialized strategies, complete particular errands, and face unmistakable security threats.Numerous clinical applications, including far off wellbeing checking that could permit carers to notice patients' medical issues continuously and medicine or therapies consistence at home by medical services

ABSTRACT

Context: Dental surgeons commonly believed that the mandibular site between the mental foramina is the safest for surgical procedures, but there have been numerous reports of significant bleeding accidents in this area. Adequate knowledge about the presence and variation in the morphology of anterior lingual foramina is necessary before starting surgical procedures such as implant placement and ridge augmentation.

Aim: The aim of this study was to analyse the presence, frequency, location and relationship of lingual foramen with the inferior border of mandible on Cone Beam Computed Tomography scans (CBCT).

Settings and design: This retrospective radiographic study was designed and conducted at Maharashtra Institute of Dental Sciences & Research, Latur, India in the Department of Periodontology after approval from the Institutional Ethical Committee.

Materials and methods: 100 CBCT scans of dentulous and partially edentulous mandible were randomly acquired and assessed in coronal, sagittal, transverse and cross-sectional views. The CBCT scans made for diagnostic purposes under field of view 15 × 5 cm, 200 μm voxel size, of patients >20 and < 70 years of age of both the genders were included. Presence of cysts, tumours, systemic diseases affecting bone, fractures, previous surgery in the inter-foraminal region and poor quality of CBCT scans were excluded. Total number of foramina, their location and vertical distance between them to inferior border of mandible were recorded.

Statistical analysis used: Data were entered in data sheets and analysed by using descriptive and inferential statistics. Qualitative data were expressed in terms of proportions while quantitative data were expressed in terms of means and standard deviation. Potential significance was evaluated with Chi square tests.

Result: 100 CBCT scans (47 male and 53 females) were randomly analysed. All participants had at least 1 lingual foramen (LF). Total 172 LF were detected on 100 CBCT scans, including 154 (89.5 %) medial LF (MLF) and 18 lateral LF (LLF) (10.4 %). Out of 154 MLF, 63.6 % were present superior and 36.4 % inferior to genial tubercles. Out of 100 subjects, single LF in 44, two in 43, three in 11, four in 1 and five in 1 patient were observed. 94.44 % LLF were observed in canine and 1st premolar region. The mean distance from the MLF and inferior border of mandible was 10.87 ± 2.99 mm, while the same for LLF was 7.1 ± 4.76 mm. About one third of the foramina were in between 13.1 and 16 mm distance from inferior border.

Conclusion: Considering the limitations of the study, the midline lingual foramen can be considered as normal regular anatomic feature with 99 % prevalence while the lateral lingual foramina occur infrequently with a lot of variability in numbers and present commonly in the canine-first premolar zone. Almost 1/3rd of midline foramina are present superior to the genial tubercles.

ABSTRACT

Hemisection is a conservative dental procedure involving the removal or separation of one root and its associated portion of the crown. This treatment is particularly appropriate when pathologies such as caries, resorption, perforation, or periodontal damage are confined to a single root, while the other root remains healthy and functional. By preserving the unaffected root and surrounding alveolar bone, hemisection not only aids in maintaining tooth structure but also creates favourable conditions for future prosthetic rehabilitation, including the placement of fixed dental prostheses. This paper presents two clinical cases treated with hemisection: one involving endodontic failure and the other characterized by periodontal involvement of a single tooth.

Keywords: Hemisection, Root resection, Mandibular molar, Furcation involvement

INTRODUCTION

Modern dentistry focuses on conserving and preserving natural teeth, to ensure that functional dentition is maintained throughout the life. However, proper periodontal, prosthetic, and endodontic evaluations are essential to ensure the appropriate selection of treatment cases.[1] The loss of posterior teeth can result in tooth migration, diminished masticatory function, and a reduction in arch length. Therefore, preserving posterior teeth is essential for maintaining oral health and functionality.[2]

Treating molars with severe decay and compromised periodontal health posed significant challenges, often leaving extraction and replacement as the only options.[3] Root resective therapies are an effective treatment option for preserving natural tooth structure and can provide patients with a viable alternative. With proper execution and good oral hygiene, root resective therapy can achieve a high success rate.[4]

Hemisection involves the sectioning of a molar when one of its roots has suffered irreversible damage due to factors such as carious lesions, endodontic infections, or periodontal disease, which is subsequently removed. This procedure is primarily performed on mandibular molars. The decision to retain a root depends on factors such as the extent and pattern of bone loss, root trunk and length, the ability to eliminate the osseous defect, and endodontic and restorative considerations. Hemisection helps to retain tooth structure and surrounding alveolar bone while also facilitating the placement of a fixed prosthesis.[5]

Abstract

Introduction: *Scientific research is fundamental to advancing healthcare quality and dental practice. This study aimed to assess the knowledge, attitude, practices, and barriers related to scientific research among undergraduate dental students in the Marathwada region.*

Methods: *A cross-sectional, web-based questionnaire survey was conducted among third-year, final-year BDS students, and interns. The survey comprised sections on demographics, knowledge, general and personal attitudes, practices, and barriers toward research. Data were analysed using descriptive statistics.*

Results: *A total of 552 students participated, with 77.9% females. Correct knowledge of research objectives was low (16%), though awareness of null hypothesis (60.1%) and double-blind trials (58%) was better. Positive attitudes were predominant, with 65.2% supporting inclusion of research methodology in the curriculum and 70% interested in research workshops. However, research practice was limited; only 20.4% attended research courses, and 12.1% had publications. The primary barrier identified was lack of time (around 50%).*

Conclusion: *Undergraduate dental students in the Marathwada region possess a foundational understanding and positive attitude toward scientific research but engage less in active research practices. Incorporating research training into the dental curriculum and providing structured opportunities could enhance student participation and foster research competency.*

Keywords *– Knowledge, Attitude, Research, Cross sectional survey, Students, Dental, Dentistry.*

ABSTRACT

Aim: This review aims to explore the development, clinical applications, and biological implications of piezosurgery, with emphasis on its role in modern dental and maxillofacial practice.

Methodology: Relevant publications were identified from peer-reviewed journals covering experimental, clinical, and comparative studies on piezoelectric bone surgery. Articles discussing periodontology, implantology, oral and maxillofacial surgery, and allied specialties were critically evaluated, particularly those contrasting piezosurgery with conventional rotary or oscillating techniques.

Results: Findings consistently demonstrate that piezosurgery enables precise and selective cutting of mineralized tissues while safeguarding soft structures. Its use in sinus floor elevation, ridge expansion, and bone harvesting has been associated with fewer complications, such as Schneiderian membrane perforation and neurosensory disturbances. Laboratory and histological data reveal improved osteoblast viability, reduced thermal damage, and favorable expression of bone-regenerative markers. These biological advantages translate into promising clinical outcomes, including enhanced implant stability. However, limitations remain, notably increased operative time, a learning curve for practitioners, and the relatively high cost of equipment.

Conclusion: Piezosurgery represents a significant advancement in minimally invasive oral surgery, combining surgical precision with biological safety. With continued refinement and integration into digital workflows, its role in contemporary surgical dentistry is expected to expand further.

Keywords: Piezosurgery, ultrasonic osteotomy, implantology, periodontology, bone healing, minimally invasive surgery

INTRODUCTION

Over the past two decades, dentistry has integrated advanced technologies aimed at improving precision, safety, and healing in surgical procedures. Among the most transformative innovations is **piezosurgery**, a technique that uses ultrasonic microvibrations to selectively cut mineralized tissues while sparing adjacent soft tissues. Since its introduction by Vercellotti in the late 1990s, piezoelectric bone surgery has become increasingly important in periodontology, implantology, oral and maxillofacial surgery, and allied fields such as otolaryngology and craniofacial surgery [1,2,3].

The rationale behind piezosurgery lies in minimizing surgical trauma while enhancing accuracy. Compared to traditional rotary instruments and oscillating saws, piezoelectric devices provide **micrometric precision, selective cutting,**

Abstract:

Stress plays a major role in our daily lives. All the people, in each and every field experience stress in their day to day lives. Dental education, when considered also is a very stressful course, as it demands expertise and efficiency in work. The huge academic overload among dental students adds to the stress. And if this stress is not managed in a proper way, this can lead to many different problems in dental students.

Material and Methods: A cross-sectional survey was done among the dental students. All the undergraduate students, from first to final years including interns were selected for the study A data was collected Using a structured questionnaire consisting of 20 questions and was circulated Through a google form. The questionnaire was randomly circulated to undergraduate Students and random responses were collected from the participants.
Descriptive analysis was conducted to understand the levels and causes of stress among undergraduate dental students Pie charts, bar charts and table of the same were obtained and analysed to get the results.

Result: This survey recorded a total of 150 responses collected from students of of MIDSR dental college, Latur. The results from the survey were analysed for descriptive data from the open ended questions. 150 subjects participated in the survey.

Conclusion: The huge academic overload and fear of failure are the main factors influencing stress in dental undergraduate students. Lack of confidence in learning the clinical skills, Moving away from home, Difficulty in patient management adds to this stress. Its now need for every dental college to implement various stress management and stress reduction programmes for students for relieving the stress.

Abstract

Hepatitis B virus (HBV) is a severe health issue globally and poses a significant morbidity and mortality risk amongst carriers. Healthcare personnel, especially dentists, are at a higher occupational risk due to their direct contact with infected patients' blood. Transmission in the dental setting is most often the result of inadequate knowledge and deficient prevention practices.

The purpose of this study was to evaluate the level of knowledge, awareness, and practice towards HBV, thus revealing misconceptions and misunderstandings that present obstacles to the delivery of quality dental care and possibly provide a baseline for future assessment of Hepatitis B awareness amongst dental students

Abstract:

Stress plays a major role in our daily lives. All the people, in each and every field experience stress in their day to day lives. Dental education, when considered also is a very stressful course, as it demands expertise and efficiency in work. The huge academic overload among dental students adds to the stress. And if this stress is not managed in a proper way, this can lead to many different problems in dental students.

Material and Methods: A cross-sectional survey was done among the dental students. All the undergraduate students, from first to final years including interns were selected for the study A data was collected Using a structured questionnaire consisting of 20 questions and was circulated Through a google form. The questionnaire was randomly circulated to undergraduate Students and random responses were collected from the participants.
Descriptive analysis was conducted to understand the levels and causes of stress among undergraduate dental students Pie charts, bar charts and table of the same were obtained and analysed to get the results.

Result: This survey recorded a total of 150 responses collected from students of of MIDSR dental college, Latur. The results from the survey were analysed for descriptive data from the open ended questions. 150 subjects participated in the survey.

Conclusion: The huge academic overload and fear of failure are the main factors influencing stress in dental undergraduate students. Lack of confidence in learning the clinical skills, Moving away from home, Difficulty in patient management adds to this stress. Its now need for every dental college to implement various stress management and stress reduction programmes for students for relieving the stress.

Abstract

Hepatitis B virus (HBV) is a severe health issue globally and poses a significant morbidity and mortality risk amongst carriers. Healthcare personnel, especially dentists, are at a higher occupational risk due to their direct contact with infected patients' blood. Transmission in the dental setting is most often the result of inadequate knowledge and deficient prevention practices.

The purpose of this study was to evaluate the level of knowledge, awareness, and practice towards HBV, thus revealing misconceptions and misunderstandings that present obstacles to the delivery of quality dental care and possibly provide a baseline for future assessment of Hepatitis B awareness amongst dental students

ABSTRACT

Aim: This review aims to explore the development, clinical applications, and biological implications of piezosurgery, with emphasis on its role in modern dental and maxillofacial practice.

Methodology: Relevant publications were identified from peer-reviewed journals covering experimental, clinical, and comparative studies on piezoelectric bone surgery. Articles discussing periodontology, implantology, oral and maxillofacial surgery, and allied specialties were critically evaluated, particularly those contrasting piezosurgery with conventional rotary or oscillating techniques.

Results: Findings consistently demonstrate that piezosurgery enables precise and selective cutting of mineralized tissues while safeguarding soft structures. Its use in sinus floor elevation, ridge expansion, and bone harvesting has been associated with fewer complications, such as Schneiderian membrane perforation and neurosensory disturbances. Laboratory and histological data reveal improved osteoblast viability, reduced thermal damage, and favorable expression of bone-regenerative markers. These biological advantages translate into promising clinical outcomes, including enhanced implant stability. However, limitations remain, notably increased operative time, a learning curve for practitioners, and the relatively high cost of equipment.

Conclusion: Piezosurgery represents a significant advancement in minimally invasive oral surgery, combining surgical precision with biological safety. With continued refinement and integration into digital workflows, its role in contemporary surgical dentistry is expected to expand further.

Keywords: Piezosurgery, ultrasonic osteotomy, implantology, periodontology, bone healing, minimally invasive surgery

INTRODUCTION

Over the past two decades, dentistry has integrated advanced technologies aimed at improving precision, safety, and healing in surgical procedures. Among the most transformative innovations is **piezosurgery**, a technique that uses ultrasonic microvibrations to selectively cut mineralized tissues while sparing adjacent soft tissues. Since its introduction by Vercellotti in the late 1990s, piezoelectric bone surgery has become increasingly important in periodontology, implantology, oral and maxillofacial surgery, and allied fields such as otolaryngology and craniofacial surgery [1,2,3].

The rationale behind piezosurgery lies in minimizing surgical trauma while enhancing accuracy. Compared to traditional rotary instruments and oscillating saws, piezoelectric devices provide **micrometric precision, selective cutting,**

ABSTRACT

Objective: The purpose of this present study was to evaluate the infuences on C -reactive protein (CRP) levels amongst individuals undergoing periodontal therapy for the purpose of treating chronic periodontitis. **Materials and methods:** The main focus of the study was to assess the systemic levels of inflammation by measuring the levels of CRP in patients with chronic periodontitis. In all 60 dentate and medically fit patients (30 males and 30 females) were included in this study. Community Periodontal Index (CPI) was used to divide these subjects into 2 groups. Group 1 comprised of healthy individuals whereas mild chronic periodontitis patients were assigned the Group 2. Collection of venous blood from all the subjects was carried out before the start of treatment and at the end of 3 months after completion of periodontal therapy. SSPS software was used for data analysis. **Results:** In Group 2 (periodontitis group), all 30 subjects (100%) had a CPI score of 3, indicating the presence of periodontitis, while Group 1 (control group) had no subjects with a CPI score of 3. In Group 1 (control group), all 30 subjects (100%) had CRP levels below 1.0 mg/L, with a mean value of 0.93 ± 0.37 mg/L, indicating normal systemic inflammatory status. In contrast, Group 2 (periodontitis group) showed elevated CRP levels, with 40% of subjects falling in the 1.0–2.0 mg/L range and 60% in the 2.0–3.0 mg/L range, resulting in a higher mean CRP value of 2.05 ± 0.29 mg/L, suggesting increased systemic inflammation associated with periodontal disease. **Conclusion:** Within the limitations of this study, it was observed that there was a progressive increase in the CRP levels whenever there was an shift from healthy state to periodontitis. Moreover, upon treating the periodontal problem, a decrease in the CRP levels was observed. Additionally, a reduction in CRP levels was observed following periodontal treatment.

INTRODUCTION

C-reactive protein (CRP) is an acute phase reactant plasma protein produced in response to diverse inflammatory stimuli.[1,2] The acute-phase reaction represents an early, non-specific and highly complex reaction of the organism to a variety of injuries such as bacterial, viral or parasitic infection and ischemic necrosis.[3] Amongst all the acute phase reactants, CRP in particular has been the focus of attention as a key marker of atherosclerosis.[4]

Periodontitis is a chronic multifactorial inflammatory disease caused by microorganisms and characterized by progressive destruction of the tooth supporting tissues leading to tooth loss. Periodontal diseases are associated with an increase in CRP (C-reactive protein) levels. Release of the cytokines such as prostaglandin-E2 (PGE2), and interleukin-1-beta (IL-1β) from the periodontal lesion, stimulate hepatocytes and circulating leukocytes to produce CRP.[5]

Easily collected and containing local and systemic-derived biomarkers, oral fluids may offer the basis for patient-specific diagnostic tests for periodontal disease. Gingival crevicular fluid (GCF) is a physiological fluid as well as an inflammatory exudate originating from the gingival plexus of blood vessels in the gingival corium, subjacent to the epithelium lining of the dentogingival space. The presence of fluid in the gingival crevice has been described since the nineteenth century.[6,7]

The purpose of this present study was to evaluate the infuences on C -reactive protein (CRP) levels amongst individuals undergoing periodontal therapy for the purpose of treating chronic periodontitis.

MATERIALS AND METHODS

The main focus of the study was to assess the systemic levels of inflammation by measuring the levels of CRP in patients with chronic periodontitis. In all 60 dentate and medically fit patients (30 males and

Original Article

Evaluation of color stability, wear, and fracture resistance of preformed Bioflx and zirconia crowns: An *in vitro* study

Yogesh J. Kale, Niketa N. Deshmukh, Mahesh V. Dadpe, Prasanna T. Dahake, Shrikant B. Kendre

Department of Pediatric and Preventive Dentistry, MIDSR Dental College and Hospital, Latur, Maharashtra, India

ABSTRACT

Background: The ideal crowns for primary teeth should be esthetic, durable, and easy to place. Preformed zirconia crowns, although the most commonly used, esthetically pleasing, require significant tooth reduction, lack flexibility and adjustability, and cause wear of opposing teeth. Recently, new high-strength, medical-grade resin polymer preformed crowns have been introduced, promising to address these limitations. **Aim:** This *in vitro* study aimed to evaluate and compare the color stability, wear, and fracture resistance of newly introduced resin polymer crowns (Bioflx) with preformed zirconia crowns. **Materials and Methods:** Forty-eight extracted human primary molars were prepared, followed by the placement of Bioflx and zirconia crowns as per the respective study groups (n = 12). The samples were subjected to thermocycling and chewing simulations to mimic aging. Pre- and postaging color stability, wear, and fracture resistance values were assessed. The mean values were calculated and the data were subjected to the statistical analysis. **Results:** Bioflx crowns exhibited significantly higher color stability compared to zirconia crowns after aging ($P < 0.001$). Bioflx crowns exhibited less volumetric wear of crown material and antagonist teeth compared to zirconia crowns ($P < 0.05$). Regarding fracture resistance, Bioflx crowns maintained their strength after aging ($P > 0.05$), whereas zirconia crowns experienced a highly significant decline in strength after aging ($P \leq 0.001$). **Conclusion:** Bioflx crowns offer a promising alternative in restorative pediatric dentistry. They demonstrate superior color stability and wear resistance and maintain adequate fracture strength following aging. Further clinical studies are warranted to validate these results and explore their broader applicability.

KEYWORDS: Bioflx crowns, color stability, fracture resistance, wear resistance, zirconia crowns

Introduction

Selecting an ideal crown for the restoration of grossly decayed teeth is challenging.[1] In pediatric dentistry, various crowns are used to restore decayed, damaged, and endodontically treated teeth, each with specific benefits and limitations.[2] Stainless steel crowns (SSCs) are highly durable, cost-effective, and resistant to wear, making them ideal for primary molars, especially in children with high caries risk or those requiring a pulpotomy or pulpectomy.[3-5] However, their metallic appearance makes them unsuitable for anterior teeth.

REVIEW ARTICLE

Assessment of Detrimental Effects of Pediatric Drug Syrups on Different Esthetic Dental Restorative Materials Used in Children: A Systematic Review

Yogesh J Kale[1], Sonali D Lingayat[2], Mahesh V Dadpe[3], Prasanna T Dahake[4], Shrikant B Kendre[5]

Received on: 12 April 2025; *Accepted on:* 16 May 2025; *Published on:* 20 June 2025

Abstract

Aim and background: Studying the effects of pediatric drugs on esthetic dental restorative materials reflects the complex interactions between pediatric oral liquid medications and restorative materials. This systematic review summarizes and assesses the adverse effects of various pediatric drug syrups on different esthetic dental restorative materials used in children by reviewing the available literature.

Methods: The assessment was conducted under the Preferred Reporting Items for Systematic Reviews and Meta-Analysis Protocols (PRISMA-P) guidelines and was officially registered on the International Prospective Register of Systematic Reviews (PROSPERO) (CRD42024499625). An extensive search of electronic databases was conducted covering the period from 1990 to December 2024 to gather articles containing relevant data. Assessment of effects on color stability and surface properties of different esthetic restorative materials was carried out followed by the quality assessment of the selected studies using the QUIN RoB tool.

Results: Eighteen studies included in this systematic review analyzed the effects of pediatric liquid medications on esthetic dental restorative materials such as glass ionomer cements (GICs); composites; and their modifications with regard to liquid medicines such as antibiotics, analgesics, antiepileptic drugs, iron supplements, and multivitamins. Composites and modified GICs demonstrated higher susceptibility to syrup-induced damage compared to traditional GICs, which show better resistance. The *in vitro* studies in this review showed a definite risk of discoloration and increased surface roughness associated with chronic use of many pediatric drug syrups.

Conclusion: Composites and modified GICs demonstrated more vulnerability to syrup-induced detrimental effects compared to traditional GICs. Most of the drug syrups used in children demonstrated the risk of discoloration and increased surface roughness, particularly those with acidic components, pigmenting agents, and high sugar content. Further research is needed to explore specific interactions between the specific liquid drugs and different esthetic dental restorative materials responsible for these effects. Also, research should focus on conducting *in vivo* and long-term studies with standardized assessment protocols.

Clinical significance: Healthcare providers should be aware of the potential effects of liquid medications on dental restorative materials. By integrating this knowledge into clinical practice, healthcare professionals can contribute to the provision of good oral health in pediatric patients.

Keywords: Color stability, Dental restorative materials, Pediatric liquid medications, Surface roughness.

World Journal of Dentistry (2025): 10.5005/jp-journals-10015-2631

Introduction

Pediatric dentists have always been confronted with the problem of replacing a missing tooth or a part of the tooth structure with artificial restorative materials while maintaining esthetics and function. The demand for natural appearance by children and parents has prompted studies to create esthetically pleasing dental materials that resemble natural teeth.[1] These restorative materials can restore cavitated esthetic areas in both anterior and posterior dentition, facilitating the rehabilitation of flawed teeth.[2] Primary teeth are generally restored using glass ionomer cement (GIC), composites, compomers, and their modifications according to the appropriate recommendations based on the particular needs of the children.[3–5] Though these materials are preferred due to their favorable esthetics and compatibility with the oral environment, they differ significantly in their color stability and susceptibility to staining upon their interaction with the oral environment and exposure to various substances.[2]

Staining or lack of color stability is a major issue that arises in all restorative materials over time and is caused by both internal and external factors. Intrinsic color changes can be influenced by a variety of factors, such as the composition of the matrix, the size, and ratio of the filler particles; inadequate polymerization; and surface roughness of the materials. The extrinsic factors include frequent consumption of acid-containing drinks, beverages, food, and acidic medicines with coloring agents/additives.[6–9] Among these, pediatric liquid medications/drug syrups are a common but often overlooked factor that may impact the physical and chemical properties of the restorative materials.

ABSTRACT

Background: The goal of this study was to assess the techniques used in earlier conducted clinical investigations on the chemomechanical eradication of dentinal caries, as well as to assess the variances in pain perception, the time required for complete caries excavation, and how microbiological analysis compared before and following caries removal in primary teeth for both Papacarie and Carisolv. **Materials and Methods:** An electronic search was conducted utilizing the databases PubMed, Google Scholar, EBSCOhost, Scopus, and the Cochrane Library. The following categories were included during the assessment process: full text randomized and controlled clinical trials published between January 2000 and December 2021 in the English language only. Adolescent and child patients with open dentinal carious lesion in primary teeth were included. The methodology of the seven clinical studies chosen was evaluated. **Results:** Findings of the study reported that the microbiota in carious dentine was dramatically reduced with the Papacarie therapy, and the pain perception decreased more in the Papacarie group, whereas Carisolv treatment took longer time for complete caries excavation as compared to Papacarie. **Conclusion:** In conclusion, Papacarie had a beneficial impact by decreasing pain and time taken during caries excavation in primary teeth. The tooth surface treated with Papacarie also demonstrated a reduced bacterial count as compared to Carisolv chemomechanical caries removal approach. Overall, Papacarie and Carisolv are viable minimally invasive and painless techniques for effective caries removal in pediatric patients.

Key Words: Caries excavation, dental caries, dentin, lactobacilli colony count, primary teeth, *Streptococcus mutans*

INTRODUCTION

The term "caries excavation" is defined as mechanical treatment of dental caries-induced tooth damage to best fit the remaining parts of the tooth to receive a filling.[1] Ogushi and Fusayama have demonstrated the two zones within a carious lesion. An inner layer of intact collagen (affected dentin) and a second zone with partially destroyed collagen fibrils that cannot be remineralized (infected dentin).[2] Dental researchers worldwide though are

Comparative evaluation of antibacterial efficacy of sequential herbal irrigation with conventional irrigation in endodontic therapy of primary teeth: A randomized controlled trial

Shrikant Bhujangrao Kendre, Anuja U. Bhatane, Mahesh Vilasrao Dadpe, Yogesh Jagannath Kale, Prasanna Trambakrao Dahake

Department of Pediatric and Preventive Dentistry, MIDSR Dental College and Hospital, Latur, Maharashtra, India

ABSTRACT

Background: Successful endodontic therapy in primary teeth relies on effective microbial control. Although conventional irrigants are effective, they pose risks such as cytotoxicity, unpleasant taste, and tissue irritation. Herbal alternatives offer a safer, biocompatible option, especially suitable for children. **Aims:** To evaluate and compare the antimicrobial efficacy of a sequential herbal irrigation protocol with a conventional irrigation protocol in the endodontic treatment of primary teeth. **Materials and Methods:** It is a split-mouth, double-blind, and randomized controlled trial that included 15 pediatric patients aged 4–8 years with bilateral primary molars indicated for pulpectomy. Group I received conventional irrigation with 3% sodium hypochlorite, 17% ethylenediaminetetraacetic acid, and 2% chlorhexidine. Group II underwent sequential herbal irrigation using ethanolic extracts of 12.5% *Salvadora persica* (Miswak), 20% *Azadirachta indica* (Neem), 2% tea tree oil, and 10% phytic acid. Pre and postirrigation microbial samples were collected and cultured to quantify *Enterococcus faecalis* and *Prevotella intermedia*. Statistical analysis used paired *t*-tests for intragroup comparisons and one-way analysis of variance for intergroup differences, with significance set at $P < 0.05$. **Results:** Both groups showed significant microbial reduction ($P < 0.0001$). Group I had 90.54% and 87.6% reductions in *E. faecalis* and *P. intermedia*, respectively, while Group II achieved 92.2% and 90.54%. Herbal irrigation showed significantly greater *E. faecalis* reduction ($P = 0.025$), but *P. intermedia* reduction was not significant ($P = 0.384$). **Conclusions:** The sequential herbal irrigation protocol showed comparable antimicrobial efficacy to conventional agents, with added benefits of safety, biocompatibility, and reduced cytotoxicity, making it a promising natural alternative in pediatric endodontics.

KEYWORDS: Antimicrobial efficacy, *Enterococcus faecalis*, herbal irrigants, miswak, neem, pediatric endodontics, phytic acid, *Prevotella intermedia*, tea tree oil

The Combination of Biomimetic Materials Enhances the Functional Differentiation of Stem Cells Exfoliated from Human Deciduous Teeth

Prasanna T Dahake[1], Shruti Bhamare[2], Yogesh Jagannath Kale[3], Mahesh V Dadpe[4], Shrikant Bhujangrao Kendre[5], Dilip Duryodhan Ghadage[6], Vijay M Kumbar[7]

Received on: 01 December 2024; *Accepted on:* 22 December 2024; *Published on:* 04 September 2025

Abstract

Introduction: Stem cell therapy has been used in a variety of clinical procedures. When introduced into a specific part of the body, these cells differentiate into a target cell type and help replace damaged tissue and improve function. This experimental study was conducted to evaluate the effect of combining various natural biomimetic materials on stem cells from human exfoliated deciduous teeth (SHED).

Materials and methods: After isolation and culturing of SHED to the fifth passage, cells were treated with a regular culture medium (Group I–negative control), osteoinduction medium (Group II–positive control), a combination of mineral trioxide aggregate plus coral (MC, group III), and a combination of Biodentine plus coral (BC, group IV). Viability was assessed using MTT assay on the 7th, 14th, and 21st days. Mineralization was evaluated by Alizarin Red S staining to detect calcium deposits at the same intervals. The anti-inflammatory potential for expression of MMP-9 and MMP-2 was analyzed using gelatin zymography. One-way ANOVA followed by *post hoc* Bonferroni test was applied for statistical comparison ($p < 0.05$).

Results: MC showed better cell viability than BC on the 14th and 21st days. However, BC demonstrated significantly better cytodifferentiation potential ($p < 0.001$) and anti-inflammatory effect ($p < 0.001$) than MC.

Conclusion: With the addition of coral, the properties of both commercially available biomimetic materials were enhanced, resulting in improved osteoinductive properties of mineral trioxide aggregate and Biodentine. The MC combination showed better cell viability and proliferation, while BC showed superior cytodifferentiation and anti-inflammatory properties. Coral, as a natural material, enhanced both formulations significantly.

Keywords: Anti-inflammatory, Biodentine, Coral, Mineral trioxide aggregate, Stem cells from human exfoliated deciduous teeth, Vital pulp therapy.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3192

Introduction

Regenerative endodontic procedures have provided alternative treatment modalities to traditional treatment options for young permanent teeth. Stem cell therapy has been used in a variety of clinical procedures.[1] Pulp tissue harbors dental progenitor cells, opening the gateway to possible therapeutic modalities to preserve the dentin–pulp complex.[2] Vital pulp therapies and pulpotomy are the most commonly used therapeutic modalities to preserve maximum dental tissue in primary and young permanent teeth. In addition, dental materials that maintain or encourage the vitality of the pulp are known as biomimetic materials and are preferred in regenerative endodontics.[3,4]

Test materials used in the present study, such as mineral trioxide aggregate (MTA) and Biodentine, are considered biomimetic materials.[5] MTA has unique stability and excellent sealing properties, along with antimicrobial effects and biocompatibility with native tissues.[6] One study demonstrated proliferation and differentiation of murine homogeneous pulp cells into odontoblast-like cells after contact with MTA, which later demonstrated adhesion, propagation, and relocation of human mesenchymal stem cells (HMSC) or stem cells from human exfoliated deciduous teeth (SHED).[7] It has demonstrated better mineralization potential and minimal inflammation in pulp tissues during clinical use, making it the most preferred material during dental treatments.[3] The main drawbacks of MTA are discoloration, prolonged setting time, and difficulty in removing the material after setting.[8]

Biodentine was first introduced in 2009 due to its several advantages over MTA.[9] Biodentine™ (Septodont, Saint-Maur-des-Fossés, Cedex, France) is frequently used in endodontic therapies and restorative procedures to regenerate tissues of the pulp–

Comparative Evaluation of Thermal Effects, Cleaning Efficacy, and Dentinal Defects of Three Rotary Systems in Primary Teeth: *In Vitro* Study

Shrikant B Kendre[1], Anuja U Bhatane[2], Yogesh J Kale[3], Mahesh V Dadpe[4], Prasanna T Dahake[5]

Received on: 04 September 2025; *Accepted on:* 14 October 2025; *Published on:* xxxx

Abstract

Aim: To compare and assess heat generation during instrumentation, debridement efficacy, and root defects caused by three nickel-titanium (Ni-Ti) rotary systems in primary teeth.

Materials and methods: Sixty-four extracted human primary molars were selected and randomly divided into four groups for cleaning and shaping ($n = 16$). Group I: hand K files, group II: Kedo-S2, group III: Kids-e-files, and group IV: Prime Pedo™ rotary system. During instrumentation, teeth in alginate-filled Eppendorf tubes were placed in a water bath with thermocouples connected at the apical and middle thirds for recording temperature changes. Postinstrumentation, teeth were sectioned for debris and defect analysis under the stereomicroscope. Data were recorded and statistically analyzed.

Results: The mean temperature rise at the middle and apical third for groups I, II, III, and IV was 0.48, 1.85, 2.20, 2.26°C, and 0.73, 3.01, 3.06, 2.85°C, respectively. Mean debris scores for groups I, II, III, and IV were 3, 2, 1.6, and 1.7, respectively. Group II had the most dentinal cracks in the coronal third (mean = 1.42), followed by group IV (mean = 1.28). Group I revealed significant differences ($p < 0.01$) in comparison with II, III, and IV.

Conclusion: All three Ni-Ti rotary systems showed temperature elevations well below the threshold level, preventing harmful thermal effects, and demonstrated superior cleaning and minimal defects, with Prime Pedo™ showing the highest efficacy.

Clinical significance: This study guides the clinician in selecting pediatric rotary systems that are more efficient than manual instrumentation, reducing operative time while maintaining minimal thermal risks and dentinal damage.

Keywords: Dentinal defects, Pediatric rotary files, Primary teeth, Root canal cleaning ability, Thermocouple.

World Journal of Dentistry (2025): 10.5005/jp-journals-10015-2718

Introduction

Preserving primary teeth through effective endodontic treatment is crucial for maintaining space, function, and esthetics in growing children.[1] However, the complex, ribbon-shaped root canals of primary molars pose significant challenges for achieving a three-dimensional seal. Traditional hand instrumentation, though reliable, is time-consuming and prone to iatrogenic errors such as canal transportation and ledging.[2] Pediatric rotary nickel-titanium (Ni-Ti) systems have emerged as a faster, more efficient alternative, revolutionizing pediatric endodontics since their introduction by Barr et al.[3]

Recent advancements have led to the development of exclusive pediatric rotary files, such as the Kedo-S2, Kids-e-files, and Prime Pedo™ systems, each with unique design features. The Kedo-S2 file, a fourth-generation system, incorporates a dual-core Ni-Ti alloy with a variable cross-section—triangular apically for minimal dentin removal and teardrop-shaped coronally for efficient debris clearance.[4] Kids-e-files are advanced heat-treated rainbow rotary files. They have CM wire Ni-Ti memory alloy, which increases flexibility and resistance to cyclic fatigue. The triangular cross-section with a 4% constant taper keeps the center stiffness and high cutting efficiency. The Prime Pedo file system consists of three files (starter, P1, P2). They are gold-treated and have triangular cross-sections—the starter file with 8% taper and P1 and P2 with 6% taper.[5] These systems operate at low speeds (250–300 rpm), reducing procedural risks while improving efficacy.[5]

Conflict of interest: None

However, concerns remain regarding heat generation during instrumentation, which can potentially damage surrounding periodontal tissues. Studies indicate that temperatures exceeding 47°C risk irreversible bone resorption, emphasizing the need for thermal safety assessments.[6] Additionally, rotary instrumentation may induce dentinal defects such as microcracks, compromising root structural integrity. The varying designs, tapers, and kinematics of different Ni-Ti systems further complicate their clinical predictability.[7]

Considering these factors, this study aims to compare and assess heat generation during instrumentation, debridement efficacy, and root defects caused by three Ni-Ti rotary systems

Adverse Effects of Paediatric Liquid Medications on Primary Teeth: A Systematic Review

NIKETA N DESHMUKH[1], YOGESH J KALE[2], MAHESH V DADPE[3], PRASANNA T DAHAKE[4], SHRIKANT B KENDRE[5]

BY-NC-ND

ABSTRACT

Introduction: Paediatric liquid medications are widely administered due to their ease of use and high compliance. Emerging evidence, however, suggests these formulations may have unintended oral health consequences. Specifically, the primary dentition may experience erosion, discolouration, and altered surface properties. Studying the adverse effects of different paediatric liquid medications on primary teeth reflects a growing understanding of the complex interactions between medications and dental health and ongoing efforts to mitigate potential risks to children's oral health.

Aim: The present systematic review was conducted to summarise and assess the effects of various paediatric drugs on primary teeth by reviewing the available literature.

Materials and Methods: The present systematic review was conducted in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Protocols (PRISMA-P) guidelines and was registered on PROSPERO (CRD42023413689). The PROSPERO record is available at https://www.crd.york.ac.uk/prospero/display_record.php?ID=CRD42023413689. An extensive search of electronic databases was conducted covering January 2000 to December 2023 to identify studies reporting adverse effects of paediatric drugs on primary teeth. Quality assessment of the included studies was performed using the Quality Assessment Tool For In Vitro Studies (QUIN) tool.

Results: After meeting the eligibility criteria 24 in-vitro studies were included. Each study analysed the effects of medications on primary teeth. Enamel erosion, increased surface roughness, and discolouration were observed with most paediatric liquid medications.

Conclusion: This systematic review, included 24 studies, demonstrated associations between paediatric liquid medications and deleterious effects on the primary dentition. These adverse effects are likely driven by the acidic components, colouring additives, and prolonged contact time of the formulations. Despite methodological variations among studies, the consistent findings across different medication classes reinforce these conclusions. By integrating this knowledge into clinical practice, healthcare professionals can contribute to the promotion of optimal oral health in paediatric patients.

Keywords: Dental caries, Dental erosion, Discolouration, Enamel loss

INTRODUCTION

Doctors recommend medications to address various health concerns [1]. The various routes of drug administration are oral, nasal, sublingual, cutaneous, parenteral, and rectal [2]. Among these, the oldest, most common, and easiest administration route is the oral route [3]. Oral drugs, such as capsules, are coated to mask unpleasant tastes and are inappropriate for use in children due to their inability to swallow them at a young age [4]. Therefore, medication in liquid form is recommended for them. Both parents and children find them easily obtainable and highly acceptable [5]. In paediatric medicine, syrups have been used for an extensive period. Their use is typically for a shorter period, but it may be a regular occurrence for some children [5]. Long-term use of sugary liquid medications increases the risk of cavities. While parents know sugar causes decay, they often overlook medications as a sugar source. Children taking medications for chronic or recurring illnesses, and even supplements, are at risk of dental caries [6,7].

Analysis of drug properties revealed that pH, viscosity, acidity, and sugar content contribute to adverse dental effects such as erosion, staining, and hypoplasia [5,8]. Studies show that children using long-term, sugar-containing medications have a higher rate of caries than those not taking such medications [8-11].

Dental erosion, defined as irreversible tooth loss from acid (not bacteria), has external and internal causes. Internal causes include stomach acid contact with the tooth, as in GERD. Extrinsic sources of dental erosion include excessive consumption of acid-containing drinks, beverages, foods, and acidic medicines [6]. A drug's erosive potential depends on its titratable acidity, pH, and pKa. Acidic formulations are often needed for effective dispersal, reactions, stability, compatibility, and taste [7,12]. Frequent ingestion (more than twice daily), night time or between-meal consumption, high viscosity, and reduced saliva flow can increase medication-induced dental erosion [1,13,14].

Certain in vitro studies have shown that drugs may disrupt the structure and hardness of enamel [12,14]. However, the literature lacks research examining how medications affect primary tooth enamel, and the results of these investigations are restricted to a limited number of drugs [15]. According to some authors [5,8], the difference in erosion between primary and permanent teeth is due to differences in their morphology. Nevertheless, there is still debate regarding the vulnerability of primary teeth to both caries and erosion compared to permanent teeth [14].

To address the lack of thorough research on paediatric medication effects on primary teeth, a systematic literature review was conducted to summarise and evaluate these effects.

MATERIALS AND METHODS

This review was conducted in compliance with the Preferred Reporting Items for Systematic Review and Meta-Analysis Protocols (PRISMA-P) statement. An extensive search of electronic databases was conducted covering January 2000 to December 2023.

Data Items

The aim of this review was to assess the effect of various paediatric liquid medications on primary teeth. The research question in PICOS format was: "What are the adverse effects of various paediatric

Comparative Evaluation of Shear Bond Strength and Microleakage of Three Different Restorative Materials in Primary Molar Teeth: An *In Vitro* Study

Mahesh V Dadpe[1], Umesh R Kendre[2], Yogesh J Kale[3], Prasanna T Dahake[4], Shrikant B Kendre[5]

Received on: 21 February 2025; *Accepted on:* 29 April 2025; *Published on:* 17 November 2025

Abstract

Background: In minimally invasive dentistry, adhesive restorative materials are widely used both as bulk restoratives and for the repair of occlusal, proximal, cervical, and multisurface cavities. These consist of conventional, modified glass ionomers, compomers, composites, and new alkasite materials. Few investigations have focused on comparing the *in vitro* behavior of recently developed restorative materials.

Aim: To compare and assess the microleakage and shear bond strength (SBS) of 3M ESPE Composite (Filtek Z350 XT), Kids-e-Restore, and Cention N in primary molar teeth.

Materials and methods: This experimental investigation was divided into three groups: Cention N was in group I, Kids-e-Restore was in group II, and 3M ESPE composite (Filtek Z350 XT) was in group III. Shear bond strength testing was done by a universal testing machine. The maximum load was recorded during the testing. Samples were analyzed through a stereomicroscope to evaluate bond failure mode. Dye penetration was used to assess microleakage, and a stereomicroscope was used for examination.

Results: 3M Filtek Z350XT had the highest SBS, and Cention N had the lowest. Kids-e-Restore showed the least amount of microleakage, then by Cention N and 3M Filtek Z350 XT.

Conclusion: Composite resin (3M Filtek Z350 XT) has better SBS than Cention N and flowable GIC (glass ionomer cement) (Kids-e-Restore) in primary molar teeth. Flowable GIC (Kids-e-Restore) showed less microleakage and is a good adjunct for class II restorations.

Keywords: Cention N, Filtek Z350 XT, Kids-e-Restore, Microleakage, Shear bond strength.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3313

Introduction

In the era of minimally invasive dentistry, adhesive restorative materials are extensively used both as bulk restorative options and for repairing occlusal, proximal, cervical, and multisurface cavities. These consist of composites, compomers, modified glass ionomers, and conventional glass ionomers.[1] An ideal restorative material should have a number of qualities, including excellent wear resistance, minimal water absorption, no microleakage, strong shear bond strength (SBS), biocompatibility, and good compressive, flexural, and tensile strength. Because of their superior mechanical qualities, resin-modified glass ionomer cements (RMGICs) and composites are regarded as better than other materials.[2]

Furthermore, composites and RMGICs also exhibit anticariogenic and fluoride-releasing properties. Within the category of adhesive restorative materials, Cention N is a novel alkasite substance. It has an alkaline filler that helps control pH and releases acid-neutralizing ions in acidic environments, preventing dental cavities. Additionally, it releases calcium and fluoride, which can help remineralize early enamel defects.[3] The monomer matrix of this novel bioactive material consists of different urethane dimethacrylates (UDMA), including UDMA, dicarbonyl dimethacrylate (DCP), polyethylene glycol 400 dimethacrylate (PEG-400 DMA), and an aromatic aliphatic component.

According to manufacturers, the material Cention N is sophisticated and has good mechanical properties that can compete with established, tried-and-true esthetic adhesive materials such as composites and RMGICs.

Source of support: Nil

Conflict of interest: None

Several studies have evaluated the fluoride release, flexural strength, and compressive strength of Cention N. Although it is not classified as a composite, *in vitro* findings indicate that Cention N exhibits superior mechanical properties compared to conventional glass ionomer cement (GIC). However, composites are preferred more often due to their wider shade availability, which Cention N lacks. A more appropriate comparison is with RMGIC, as both materials allow bulk filling and curing.[4,5]

Kids-e-Restore is a resin-reinforced glass ionomer restorative that is self-adhesive, light-cured, flowable, and ready to use. By releasing fluoride, it enhances antibacterial and anti-inflammatory action, has self-adhesive technology, and does away with etching and bonding processes that require chemical adhesion. There

SYSTEMATIC REVIEW

Factors Affecting Success and Failure of Pulpectomy in Primary Teeth: A Systematic Review

Shrikant Bhujangrao Kendre[1], Anuja U Bhatane[2], Yogesh Jagannath Kale[3], Mahesh V Dadpe[4], Prasanna T Dahake[5]

Received on: 25 January 2025; *Accepted on:* 02 May 2025; *Published on:* 16 December 2025

Abstract

Aims and background: A pulpectomy in primary teeth is considered successful when there are no clinical symptoms or radiographic evidence of pathology. Outcomes vary due to multiple influencing factors, and comprehensive long-term evidence remains limited. This systematic review evaluates pulpectomy success over long-term follow-ups and identifies risk factors for failure.

Methods: An electronic database search was conducted in PubMed, EBSCOhost, Scopus, and Cochrane from January, 1990 to December 30, 2024. Different keywords were employed in various combinations during the search process to find all possible articles focused on our subject. The Cochrane risk of bias tool (ROB 2.0) was employed for evaluating randomized controlled trials, whereas observational studies were assessed using the ROBINS-I tool.

Results: A total of 360 articles were reviewed, and only 12 satisfied the inclusion requirements. The success rate of pulpectomy ranged between 38.5% and 96.2% over 5 years. The minimum amount of preoperative root resorption and adequate length of root canal filling material are the common factors associated with the success of pulpectomy. Zinc oxide eugenol (ZOE) and Endoflas success rate were 90% and 71% or less for iodoform after 18 months of evaluation.

Conclusion: Factors associated with the success of pulpectomy were an absence of preoperative periapical lesions, minimal preoperative root resorption, adequate root canal filling, and the type of postendodontic restoration. The factors associated with pulpectomy failure were the presence of a periapical lesion, preoperative swelling, fistula, pulpectomy performed in trauma cases, and inadequate quality of the root filling. Age, gender, tooth position, treatment modality, and number of appointments did not significantly affect pulpectomy.

Clinical significance: This systematic review holds significant clinical value as it enhances treatment predictability, minimizes failures, and supports the preservation of primary teeth, ultimately benefiting pediatric oral health.

Keywords: Clinical and radiographic evaluation, Factors, Longevity, Primary teeth, Pulpectomy, Success and failure, Survival rate.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3343

Introduction

Involvement of pulp due to caries or trauma in primary teeth leads to irreversible damage, causing degeneration or necrosis. To preserve such a tooth in the oral cavity to maintain function as well as arch integrity, an endodontic procedure like pulpectomy is indicated.[1] Following all the standard procedural protocols, the primary teeth are preserved in the oral cavity. To consider the procedure successful, the absence of signs and symptoms clinically and radiographically is considered as prime criteria.[2] Several studies and ongoing research have shown that pulpectomy has a better prognosis as a treatment modality. However, conclusive findings are still elusive. Success and failure can be determined by a wide range of possible factors that are inconsistent. The success rate can differ according to the preoperative findings, such as lesion etiology, type of lesion, type of filling materials, and the clinician's expertise. The failure was more likely to occur in patients with greater levels of gingivitis and visible plaque. Additionally, risk variables for failure were identified as the presence or absence of full coronal restoration.

The review on pulp treatment techniques for extensively decayed primary teeth published in Cochrane in 2018 had certain limitations that included both vital and nonvital pulp therapies without a focused analysis on pulpectomy procedures. Additionally, the included evidence was current only up to August, 2017, potentially omitting recent advancements in the area.[3] Another systematic review published in 2019 exclusively assessed the success of zinc oxide eugenol (ZOE) and calcium hydroxide-iodoform paste about the quality of obturation for pulpectomy procedures in primary teeth and did not evaluate the factors.[4]

A systematic review published in 2020 on randomized controlled trials assessed success rates for nonvital therapy in primary teeth and compared lesion sterilization and tissue repair (LSTR) with pulpectomy for a 6–12 months follow-up.[5] This paper, being a short-term evaluation, represents a significant limitation, contrary to more predictable long-term treatment success. Hence, an evident gap was found to exist in the last 4 years regarding substantial comparative papers for such findings.

Abstract:

Supernumerary teeth, also known as hyperdontia, refer to the presence of additional teeth beyond the normal dental count in the arch. The prevalence of supernumerary teeth in the anterior region is 2.2%, with mesiodens accounting for 78.4% of these cases. Mesiodens, the most common type of supernumerary teeth, can cause several complications, including spacing, crowding, eruption issues, and esthetic concerns. These anomalies are particularly significant during the primary and early mixed dentition stages, as they can lead to various dental problems such as speech difficulties, resorption of adjacent tooth roots, delayed eruption of permanent incisors, and the potential development of dentigerous cysts. Early identification and management of mesiodens are crucial to avoid further complications in permanent dentition. The current paper focuses on seven cases of mesiodens identified during the primary, mixed and permanent dentition phase, along with their effective management strategies.

Keywords: Mesiodens, Supernumerary tooth, Pediatric dentistry, Case reports

INTRODUCTION:

Supernumerary teeth are additional teeth that develop in the mouth and can affect the eruption and alignment of normal teeth.1 Mesiodens are the most common type of supernumerary teeth, typically found in the maxillary anterior region between the central incisors. The prevalence of supernumerary teeth is 0.15–1% in permanent dentition and 0.3–0.6% in the primary dentition with predilection of 2:1 for male sex.2 These teeth are often identified during routine dental examinations or as a result of complications such as delayed eruption, diastema, displacement of adjacent teeth, or root resorption.3 While mesiodens may remain asymptomatic, their presence near critical anatomical structures such as the nasal floor can pose diagnostic and surgical challenges. It can affect both maxilla and mandible; however, its occurrence in the mandible is rare.4 The most common type of supernumerary tooth as indicated by Alberti et al is mesiodens. Mesiodens may occur as single, multiple, unilateral or bilateral.5 The exact etiology of mesiodens tooth is not clearly known, though various theories have been suggested, including dichotomy of the tooth bud, hyperactivity of the dental lamina and combination of genetic-environmental factors. Single supernumerary teeth may be seen in association with conditions like cleft lip and/or palate, Downs syndromes, Cleidocranial dysplasia, etc.6 In some syndromes, mesiodens may present as a part of the

[5]Reader, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

Abstract:

In order to save carious primary teeth until their natural exfoliation and retain the structure and function of the arch, pulpectomy is still a fundamental treatment in Pediatric dentistry. The mechanical and biological characteristics of the obturating substance utilized have a significant impact on the pulpectomy's long-term success. The conventional option of zinc oxide-eugenol (ZOE) has drawbacks such cytotoxicity and delayed resorption. The powerful antibacterial, anti-inflammatory, and healing-promoting qualities of zinc oxide-ozonated oil (ZnO-OO) have drawn attention recently. This review compares the performance of ZnO-OO with both established and novel materials, combining the recent data from four important in vivo investigations. ZnO-OO is an appealing option for juvenile endodontics because of its high clinical and radiographic success, remarkable biocompatibility, and exceptional handling qualities, as shown by consistent results.

Keywords: Narrative Review, Obturating Material, Pediatric Dentistry, Pulpectomy, Zinc Oxide Ozonated Oil

INTRODUCTION:

Mastication, phonation, aesthetics, and directing the emergence of permanent teeth are all critical functions of primary teeth. It is crucial to keep these teeth intact until their natural exfoliation, particularly if pulp diseases are present. Pulpectomy is recommended when primary teeth exhibit permanent pulpitis or necrosis. This procedure entails total debridement and obturation of the root canal system. The optimal obturating material should be radiopaque, biocompatible, resorbable, antibacterial, and easy to apply without interfering with succeeding eruption.

Because of its antibacterial properties and track record of dependability, zinc oxide-eugenol (ZOE) has been utilized extensively. Nevertheless, it may not resorb as quickly as primary roots and may remain in the periapical area, which may interfere with the permanent successors' eruptive route and result in periapical inflammation1. Furthermore, at high doses, the eugenol component is cytotoxic2,3,4. Alternative materials like calcium hydroxide, iodoform-based pastes (like Vitapex), herbal formulations, and biologically inspired combinations like 3Mix have been investigated as a result. Because of its biological qualities, which include antibacterial activity, debriding impact, angiogenesis promotion,

Evaluation of color stability, wear, and fracture resistance of preformed Bioflx and zirconia crowns: An *in vitro* study

Yogesh J. Kale, Niketa N. Deshmukh, Mahesh V. Dadpe, Prasanna T. Dahake, Shrikant B. Kendre

Department of Pediatric and Preventive Dentistry, MIDSR Dental College and Hospital, Latur, Maharashtra, India

ABSTRACT

Background: The ideal crowns for primary teeth should be esthetic, durable, and easy to place. Preformed zirconia crowns, although the most commonly used, esthetically pleasing, require significant tooth reduction, lack flexibility and adjustability, and cause wear of opposing teeth. Recently, new high-strength, medical-grade resin polymer preformed crowns have been introduced, promising to address these limitations. **Aim:** This *in vitro* study aimed to evaluate and compare the color stability, wear, and fracture resistance of newly introduced resin polymer crowns (Bioflx) with preformed zirconia crowns. **Materials and Methods:** Forty-eight extracted human primary molars were prepared, followed by the placement of Bioflx and zirconia crowns as per the respective study groups (n = 12). The samples were subjected to thermocycling and chewing simulations to mimic aging. Pre- and postaging color stability, wear, and fracture resistance values were assessed. The mean values were calculated and the data were subjected to the statistical analysis. **Results:** Bioflx crowns exhibited significantly higher color stability compared to zirconia crowns after aging (P < 0.001). Bioflx crowns exhibited less volumetric wear of crown material and antagonist teeth compared to zirconia crowns (P < 0.05). Regarding fracture resistance, Bioflx crowns maintained their strength after aging (P > 0.05), whereas zirconia crowns experienced a highly significant decline in strength after aging ($P \leq 0.001$). **Conclusion:** Bioflx crowns offer a promising alternative in restorative pediatric dentistry. They demonstrate superior color stability and wear resistance and maintain adequate fracture strength following aging. Further clinical studies are warranted to validate these results and explore their broader applicability.

Introduction

Selecting an ideal crown for the restoration of grossly decayed teeth is challenging.[1] In pediatric dentistry, various crowns are used to restore decayed, damaged, and endodontically treated teeth, each with specific benefits and limitations.[2] Stainless steel crowns (SSCs) are highly durable, cost-effective, and resistant to wear, making them ideal for primary molars, especially in children with high caries risk or those requiring a pulpotomy or pulpectomy.[3-5] However, their metallic appearance makes them unsuitable for anterior teeth.

Assessment of Detrimental Effects of Pediatric Drug Syrups on Different Esthetic Dental Restorative Materials Used in Children: A Systematic Review

Yogesh J Kale[1], Sonali D Lingayat[2], Mahesh V Dadpe[3], Prasanna T Dahake[4], Shrikant B Kendre[5]

Received on: 12 April 2025; *Accepted on:* 16 May 2025; *Published on:* 20 June 2025

Abstract

Aim and background: Studying the effects of pediatric drugs on esthetic dental restorative materials reflects the complex interactions between pediatric oral liquid medications and restorative materials. This systematic review summarizes and assesses the adverse effects of various pediatric drug syrups on different esthetic dental restorative materials used in children by reviewing the available literature.

Methods: The assessment was conducted under the Preferred Reporting Items for Systematic Reviews and Meta-Analysis Protocols (PRISMA-P) guidelines and was officially registered on the International Prospective Register of Systematic Reviews (PROSPERO) (CRD42024499625). An extensive search of electronic databases was conducted covering the period from 1990 to December 2024 to gather articles containing relevant data. Assessment of effects on color stability and surface properties of different esthetic restorative materials was carried out followed by the quality assessment of the selected studies using the QUIN RoB tool.

Results: Eighteen studies included in this systematic review analyzed the effects of pediatric liquid medications on esthetic dental restorative materials such as glass ionomer cements (GICs); composites; and their modifications with regard to liquid medicines such as antibiotics, analgesics, antiepileptic drugs, iron supplements, and multivitamins. Composites and modified GICs demonstrated higher susceptibility to syrup-induced damage compared to traditional GICs, which show better resistance. The *in vitro* studies in this review showed a definite risk of discoloration and increased surface roughness associated with chronic use of many pediatric drug syrups.

Conclusion: Composites and modified GICs demonstrated more vulnerability to syrup-induced detrimental effects compared to traditional GICs. Most of the drug syrups used in children demonstrated the risk of discoloration and increased surface roughness, particularly those with acidic components, pigmenting agents, and high sugar content. Further research is needed to explore specific interactions between the specific liquid drugs and different esthetic dental restorative materials responsible for these effects. Also, research should focus on conducting *in vivo* and long-term studies with standardized assessment protocols.

Clinical significance: Healthcare providers should be aware of the potential effects of liquid medications on dental restorative materials. By integrating this knowledge into clinical practice, healthcare professionals can contribute to the provision of good oral health in pediatric patients.

Keywords: Color stability, Dental restorative materials, Pediatric liquid medications, Surface roughness.

World Journal of Dentistry (2025): 10.5005/jp-journals-10015-2631

Introduction

Pediatric dentists have always been confronted with the problem of replacing a missing tooth or a part of the tooth structure with artificial restorative materials while maintaining esthetics and function. The demand for natural appearance by children and parents has prompted studies to create esthetically pleasing dental materials that resemble natural teeth.[1] These restorative materials can restore cavitated esthetic areas in both anterior and posterior dentition, facilitating the rehabilitation of flawed teeth.[2] Primary teeth are generally restored using glass ionomer cement (GIC), composites, compomers, and their modifications according to the appropriate recommendations based on the particular needs of the children.[3–5] Though these materials are preferred due to their favorable esthetics and compatibility with the oral environment, they differ significantly in their color stability and susceptibility to staining upon their interaction with the oral environment and exposure to various substances.[2]

Staining or lack of color stability is a major issue that arises in all restorative materials over time and is caused by both internal and external factors. Intrinsic color changes can be influenced by a variety of factors, such as the composition of the matrix, the size, and ratio of the filler particles; inadequate polymerization; and surface roughness of the materials. The extrinsic factors include frequent consumption of acid-containing drinks, beverages, food, and acidic medicines with coloring agents/additives.[6–9] Among these, pediatric liquid medications/drug syrups are a common but often overlooked factor that may impact the physical and chemical properties of the restorative materials.

ABSTRACT

Background: The goal of this study was to assess the techniques used in earlier conducted clinical investigations on the chemomechanical eradication of dentinal caries, as well as to assess the variances in pain perception, the time required for complete caries excavation, and how microbiological analysis compared before and following caries removal in primary teeth for both Papacarie and Carisolv. **Materials and Methods:** An electronic search was conducted utilizing the databases PubMed, Google Scholar, EBSCOhost, Scopus, and the Cochrane Library. The following categories were included during the assessment process: full text randomized and controlled clinical trials published between January 2000 and December 2021 in the English language only. Adolescent and child patients with open dentinal carious lesion in primary teeth were included. The methodology of the seven clinical studies chosen was evaluated. **Results:** Findings of the study reported that the microbiota in carious dentine was dramatically reduced with the Papacarie therapy, and the pain perception decreased more in the Papacarie group, whereas Carisolv treatment took longer time for complete caries excavation as compared to Papacarie. **Conclusion:** In conclusion, Papacarie had a beneficial impact by decreasing pain and time taken during caries excavation in primary teeth. The tooth surface treated with Papacarie also demonstrated a reduced bacterial count as compared to Carisolv chemomechanical caries removal approach. Overall, Papacarie and Carisolv are viable minimally invasive and painless techniques for effective caries removal in pediatric patients.

Key Words: Caries excavation, dental caries, dentin, lactobacilli colony count, primary teeth, *Streptococcus mutans*

INTRODUCTION

The term "caries excavation" is defined as mechanical treatment of dental caries-induced tooth damage to best fit the remaining parts of the tooth to receive a filling.[1] Ogushi and Fusayama have demonstrated the two zones within a carious lesion. An inner layer of intact collagen (affected dentin) and a second zone with partially destroyed collagen fibrils that cannot be remineralized (infected dentin).[2] Dental researchers worldwide though are

Comparative evaluation of antibacterial efficacy of sequential herbal irrigation with conventional irrigation in endodontic therapy of primary teeth: A randomized controlled trial

Shrikant Bhujangrao Kendre, Anuja U. Bhatane, Mahesh Vilasrao Dadpe, Yogesh Jagannath Kale, Prasanna Trambakrao Dahake

Department of Pediatric and Preventive Dentistry, MIDSR Dental College and Hospital, Latur, Maharashtra, India

ABSTRACT

Background: Successful endodontic therapy in primary teeth relies on effective microbial control. Although conventional irrigants are effective, they pose risks such as cytotoxicity, unpleasant taste, and tissue irritation. Herbal alternatives offer a safer, biocompatible option, especially suitable for children. **Aims:** To evaluate and compare the antimicrobial efficacy of a sequential herbal irrigation protocol with a conventional irrigation protocol in the endodontic treatment of primary teeth. **Materials and Methods:** It is a split-mouth, double-blind, and randomized controlled trial that included 15 pediatric patients aged 4–8 years with bilateral primary molars indicated for pulpectomy. Group I received conventional irrigation with 3% sodium hypochlorite, 17% ethylenediaminetetraacetic acid, and 2% chlorhexidine. Group II underwent sequential herbal irrigation using ethanolic extracts of 12.5% *Salvadora persica* (Miswak), 20% *Azadirachta indica* (Neem), 2% tea tree oil, and 10% phytic acid. Pre and postirrigation microbial samples were collected and cultured to quantify *Enterococcus faecalis* and *Prevotella intermedia*. Statistical analysis used paired *t*-tests for intragroup comparisons and one-way analysis of variance for intergroup differences, with significance set at $P < 0.05$. **Results:** Both groups showed significant microbial reduction ($P < 0.0001$). Group I had 90.54% and 87.6% reductions in *E. faecalis* and *P. intermedia*, respectively, while Group II achieved 92.2% and 90.54%. Herbal irrigation showed significantly greater *E. faecalis* reduction ($P = 0.025$), but *P. intermedia* reduction was not significant ($P = 0.384$). **Conclusions:** The sequential herbal irrigation protocol showed comparable antimicrobial efficacy to conventional agents, with added benefits of safety, biocompatibility, and reduced cytotoxicity, making it a promising natural alternative in pediatric endodontics.

The Combination of Biomimetic Materials Enhances the Functional Differentiation of Stem Cells Exfoliated from Human Deciduous Teeth

Prasanna T Dahake[1], Shruti Bhamare[2], Yogesh Jagannath Kale[3], Mahesh V Dadpe[4], Shrikant Bhujangrao Kendre[5], Dilip Duryodhan Ghadage[6], Vijay M Kumbar[7]

Received on: 01 December 2024; *Accepted on:* 22 December 2024; *Published on:* 04 September 2025

Abstract

Introduction: Stem cell therapy has been used in a variety of clinical procedures. When introduced into a specific part of the body, these cells differentiate into a target cell type and help replace damaged tissue and improve function. This experimental study was conducted to evaluate the effect of combining various natural biomimetic materials on stem cells from human exfoliated deciduous teeth (SHED).

Materials and methods: After isolation and culturing of SHED to the fifth passage, cells were treated with a regular culture medium (Group I–negative control), osteoinduction medium (Group II–positive control), a combination of mineral trioxide aggregate plus coral (MC, group III), and a combination of Biodentine plus coral (BC, group IV). Viability was assessed using MTT assay on the 7th, 14th, and 21st days. Mineralization was evaluated by Alizarin Red S staining to detect calcium deposits at the same intervals. The anti-inflammatory potential for expression of MMP-9 and MMP-2 was analyzed using gelatin zymography. One-way ANOVA followed by *post hoc* Bonferroni test was applied for statistical comparison ($p < 0.05$).

Results: MC showed better cell viability than BC on the 14th and 21st days. However, BC demonstrated significantly better cytodifferentiation potential ($p < 0.001$) and anti-inflammatory effect ($p < 0.001$) than MC.

Conclusion: With the addition of coral, the properties of both commercially available biomimetic materials were enhanced, resulting in improved osteoinductive properties of mineral trioxide aggregate and Biodentine. The MC combination showed better cell viability and proliferation, while BC showed superior cytodifferentiation and anti-inflammatory properties. Coral, as a natural material, enhanced both formulations significantly.

Keywords: Anti-inflammatory, Biodentine, Coral, Mineral trioxide aggregate, Stem cells from human exfoliated deciduous teeth, Vital pulp therapy.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3192

Introduction

Regenerative endodontic procedures have provided alternative treatment modalities to traditional treatment options for young permanent teeth. Stem cell therapy has been used in a variety of clinical procedures.[1] Pulp tissue harbors dental progenitor cells, opening the gateway to possible therapeutic modalities to preserve the dentin–pulp complex.[2] Vital pulp therapies and pulpotomy are the most commonly used therapeutic modalities to preserve maximum dental tissue in primary and young permanent teeth. In addition, dental materials that maintain or encourage the vitality of the pulp are known as biomimetic materials and are preferred in regenerative endodontics.[3,4]

Test materials used in the present study, such as mineral trioxide aggregate (MTA) and Biodentine, are considered biomimetic materials.[5] MTA has unique stability and excellent sealing properties, along with antimicrobial effects and biocompatibility with native tissues.[6] One study demonstrated proliferation and differentiation of murine homogeneous pulp cells into odontoblast-like cells after contact with MTA, which later demonstrated adhesion, propagation, and relocation of human mesenchymal stem cells (HMSC) or stem cells from human exfoliated deciduous teeth (SHED).[7] It has demonstrated better mineralization potential and minimal inflammation in pulp tissues during clinical use, making it the most preferred material during dental treatments.[3] The main drawbacks of MTA are discoloration, prolonged setting time, and difficulty in removing the material after setting.[8]

Biodentine was first introduced in 2009 due to its several advantages over MTA.[9] Biodentine™ (Septodont, Saint-Maur-des-Fossés, Cedex, France) is frequently used in endodontic therapies and restorative procedures to regenerate tissues of the pulp–

Comparative Evaluation of Thermal Effects, Cleaning Efficacy, and Dentinal Defects of Three Rotary Systems in Primary Teeth: *In Vitro* Study

Shrikant B Kendre[1], Anuja U Bhatane[2], Yogesh J Kale[3], Mahesh V Dadpe[4], Prasanna T Dahake[5]

Received on: 04 September 2025; *Accepted on:* 14 October 2025; *Published on:* xxxx

Abstract

Aim: To compare and assess heat generation during instrumentation, debridement efficacy, and root defects caused by three nickel-titanium (Ni-Ti) rotary systems in primary teeth.

Materials and methods: Sixty-four extracted human primary molars were selected and randomly divided into four groups for cleaning and shaping ($n = 16$). Group I: hand K files, group II: Kedo-S2, group III: Kids-e-files, and group IV: Prime Pedo™ rotary system. During instrumentation, teeth in alginate-filled Eppendorf tubes were placed in a water bath with thermocouples connected at the apical and middle thirds for recording temperature changes. Postinstrumentation, teeth were sectioned for debris and defect analysis under the stereomicroscope. Data were recorded and statistically analyzed.

Results: The mean temperature rise at the middle and apical third for groups I, II, III, and IV was 0.48, 1.85, 2.20, 2.26°C, and 0.73, 3.01, 3.06, 2.85°C, respectively. Mean debris scores for groups I, II, III, and IV were 3, 2, 1.6, and 1.7, respectively. Group II had the most dentinal cracks in the coronal third (mean = 1.42), followed by group IV (mean = 1.28). Group I revealed significant differences ($p < 0.01$) in comparison with II, III, and IV.

Conclusion: All three Ni-Ti rotary systems showed temperature elevations well below the threshold level, preventing harmful thermal effects, and demonstrated superior cleaning and minimal defects, with Prime Pedo™ showing the highest efficacy.

Clinical significance: This study guides the clinician in selecting pediatric rotary systems that are more efficient than manual instrumentation, reducing operative time while maintaining minimal thermal risks and dentinal damage.

Keywords: Dentinal defects, Pediatric rotary files, Primary teeth, Root canal cleaning ability, Thermocouple.

World Journal of Dentistry (2025): 10.5005/jp-journals-10015-2718

Introduction

Preserving primary teeth through effective endodontic treatment is crucial for maintaining space, function, and esthetics in growing children.[1] However, the complex, ribbon-shaped root canals of primary molars pose significant challenges for achieving a three-dimensional seal. Traditional hand instrumentation, though reliable, is time-consuming and prone to iatrogenic errors such as canal transportation and ledging.[2] Pediatric rotary nickel-titanium (Ni-Ti) systems have emerged as a faster, more efficient alternative, revolutionizing pediatric endodontics since their introduction by Barr et al.[3]

Recent advancements have led to the development of exclusive pediatric rotary files, such as the Kedo-S2, Kids-e-files, and Prime Pedo™ systems, each with unique design features. The Kedo-S2 file, a fourth-generation system, incorporates a dual-core Ni-Ti alloy with a variable cross-section—triangular apically for minimal dentin removal and teardrop-shaped coronally for efficient debris clearance.[4] Kids-e-files are advanced heat-treated rainbow rotary files. They have CM wire Ni-Ti memory alloy, which increases flexibility and resistance to cyclic fatigue. The triangular cross-section with a 4% constant taper keeps the center stiffness and high cutting efficiency. The Prime Pedo file system consists of three files (starter, P1, P2). They are gold-treated and have triangular cross-sections—the starter file with 8% taper and P1 and P2 with 6% taper.[5] These systems operate at low speeds (250–300 rpm), reducing procedural risks while improving efficacy.[5]

Conflict of interest: None

However, concerns remain regarding heat generation during instrumentation, which can potentially damage surrounding periodontal tissues. Studies indicate that temperatures exceeding 47°C risk irreversible bone resorption, emphasizing the need for thermal safety assessments.[6] Additionally, rotary instrumentation may induce dentinal defects such as microcracks, compromising root structural integrity. The varying designs, tapers, and kinematics of different Ni-Ti systems further complicate their clinical predictability.[7]

Considering these factors, this study aims to compare and assess heat generation during instrumentation, debridement efficacy, and root defects caused by three Ni-Ti rotary systems

Adverse Effects of Paediatric Liquid Medications on Primary Teeth: A Systematic Review

NIKETA N DESHMUKH[1], YOGESH J KALE[2], MAHESH V DADPE[3], PRASANNA T DAHAKE[4], SHRIKANT B KENDRE[5]

(cc) BY-NC-ND

ABSTRACT

Introduction: Paediatric liquid medications are widely administered due to their ease of use and high compliance. Emerging evidence, however, suggests these formulations may have unintended oral health consequences. Specifically, the primary dentition may experience erosion, discolouration, and altered surface properties. Studying the adverse effects of different paediatric liquid medications on primary teeth reflects a growing understanding of the complex interactions between medications and dental health and ongoing efforts to mitigate potential risks to children's oral health.

Aim: The present systematic review was conducted to summarise and assess the effects of various paediatric drugs on primary teeth by reviewing the available literature.

Materials and Methods: The present systematic review was conducted in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Protocols (PRISMA-P) guidelines and was registered on PROSPERO (CRD42023413689). The PROSPERO record is available at https://www.crd.york.ac.uk/prospero/display_record.php?ID=CRD42023413689. An extensive search of electronic databases was conducted covering January 2000 to December 2023 to identify studies reporting adverse effects of paediatric drugs on primary teeth. Quality assessment of the included studies was performed using the Quality Assessment Tool For In Vitro Studies (QUIN) tool.

Results: After meeting the eligibility criteria 24 in-vitro studies were included. Each study analysed the effects of medications on primary teeth. Enamel erosion, increased surface roughness, and discolouration were observed with most paediatric liquid medications.

Conclusion: This systematic review, included 24 studies, demonstrated associations between paediatric liquid medications and deleterious effects on the primary dentition. These adverse effects are likely driven by the acidic components, colouring additives, and prolonged contact time of the formulations. Despite methodological variations among studies, the consistent findings across different medication classes reinforce these conclusions. By integrating this knowledge into clinical practice, healthcare professionals can contribute to the promotion of optimal oral health in paediatric patients.

Keywords: Dental caries, Dental erosion, Discolouration, Enamel loss

INTRODUCTION

Doctors recommend medications to address various health concerns [1]. The various routes of drug administration are oral, nasal, sublingual, cutaneous, parenteral, and rectal [2]. Among these, the oldest, most common, and easiest administration route is the oral route [3]. Oral drugs, such as capsules, are coated to mask unpleasant tastes and are inappropriate for use in children due to their inability to swallow them at a young age [4]. Therefore, medication in liquid form is recommended for them. Both parents and children find them easily obtainable and highly acceptable [5]. In paediatric medicine, syrups have been used for an extensive period. Their use is typically for a shorter period, but it may be a regular occurrence for some children [5]. Long-term use of sugary liquid medications increases the risk of cavities. While parents know sugar causes decay, they often overlook medications as a sugar source. Children taking medications for chronic or recurring illnesses, and even supplements, are at risk of dental caries [6,7].

Analysis of drug properties revealed that pH, viscosity, acidity, and sugar content contribute to adverse dental effects such as erosion, staining, and hypoplasia [5,8]. Studies show that children using long-term, sugar-containing medications have a higher rate of caries than those not taking such medications [8-11].

Dental erosion, defined as irreversible tooth loss from acid (not bacteria), has external and internal causes. Internal causes include stomach acid contact with the tooth, as in GERD. Extrinsic sources of dental erosion include excessive consumption of acid-containing drinks, beverages, foods, and acidic medicines [6]. A drug's erosive potential depends on its titratable acidity, pH, and pKa. Acidic formulations are often needed for effective dispersal, reactions, stability, compatibility, and taste [7,12]. Frequent ingestion (more than twice daily), night time or between-meal consumption, high viscosity, and reduced saliva flow can increase medication-induced dental erosion [1,13,14].

Certain in vitro studies have shown that drugs may disrupt the structure and hardness of enamel [12,14]. However, the literature lacks research examining how medications affect primary tooth enamel, and the results of these investigations are restricted to a limited number of drugs [15]. According to some authors [5,8], the difference in erosion between primary and permanent teeth is due to differences in their morphology. Nevertheless, there is still debate regarding the vulnerability of primary teeth to both caries and erosion compared to permanent teeth [14].

To address the lack of thorough research on paediatric medication effects on primary teeth, a systematic literature review was conducted to summarise and evaluate these effects.

MATERIALS AND METHODS

This review was conducted in compliance with the Preferred Reporting Items for Systematic Review and Meta-Analysis Protocols (PRISMA-P) statement. An extensive search of electronic databases was conducted covering January 2000 to December 2023.

Data Items

The aim of this review was to assess the effect of various paediatric liquid medications on primary teeth. The research question in PICOS format was: "What are the adverse effects of various paediatric

Comparative Evaluation of Shear Bond Strength and Microleakage of Three Different Restorative Materials in Primary Molar Teeth: An *In Vitro* Study

Mahesh V Dadpe[1], Umesh R Kendre[2], Yogesh J Kale[3], Prasanna T Dahake[4], Shrikant B Kendre[5]

Received on: 21 February 2025; *Accepted on:* 29 April 2025; *Published on:* 17 November 2025

Abstract

Background: In minimally invasive dentistry, adhesive restorative materials are widely used both as bulk restoratives and for the repair of occlusal, proximal, cervical, and multisurface cavities. These consist of conventional, modified glass ionomers, compomers, composites, and new alkasite materials. Few investigations have focused on comparing the *in vitro* behavior of recently developed restorative materials.

Aim: To compare and assess the microleakage and shear bond strength (SBS) of 3M ESPE Composite (Filtek Z350 XT), Kids-e-Restore, and Cention N in primary molar teeth.

Materials and methods: This experimental investigation was divided into three groups: Cention N was in group I, Kids-e-Restore was in group II, and 3M ESPE composite (Filtek Z350 XT) was in group III. Shear bond strength testing was done by a universal testing machine. The maximum load was recorded during the testing. Samples were analyzed through a stereomicroscope to evaluate bond failure mode. Dye penetration was used to assess microleakage, and a stereomicroscope was used for examination.

Results: 3M Filtek Z350XT had the highest SBS, and Cention N had the lowest. Kids-e-Restore showed the least amount of microleakage, then by Cention N and 3M Filtek Z350 XT.

Conclusion: Composite resin (3M Filtek Z350 XT) has better SBS than Cention N and flowable GIC (glass ionomer cement) (Kids-e-Restore) in primary molar teeth. Flowable GIC (Kids-e-Restore) showed less microleakage and is a good adjunct for class II restorations.

Keywords: Cention N, Filtek Z350 XT, Kids-e-Restore, Microleakage, Shear bond strength.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3313

Introduction

In the era of minimally invasive dentistry, adhesive restorative materials are extensively used both as bulk restorative options and for repairing occlusal, proximal, cervical, and multisurface cavities. These consist of composites, compomers, modified glass ionomers, and conventional glass ionomers.[1] An ideal restorative material should have a number of qualities, including excellent wear resistance, minimal water absorption, no microleakage, strong shear bond strength (SBS), biocompatibility, and good compressive, flexural, and tensile strength. Because of their superior mechanical qualities, resin-modified glass ionomer cements (RMGICs) and composites are regarded as better than other materials.[2]

Furthermore, composites and RMGICs also exhibit anticariogenic and fluoride-releasing properties. Within the category of adhesive restorative materials, Cention N is a novel alkasite substance. It has an alkaline filler that helps control pH and releases acid-neutralizing ions in acidic environments, preventing dental cavities. Additionally, it releases calcium and fluoride, which can help remineralize early enamel defects.[3] The monomer matrix of this novel bioactive material consists of different urethane dimethacrylates (UDMA), including UDMA, dicarbonyl dimethacrylate (DCP), polyethylene glycol 400 dimethacrylate (PEG-400 DMA), and an aromatic aliphatic component.

According to manufacturers, the material Cention N is sophisticated and has good mechanical properties that can compete with established, tried-and-true esthetic adhesive materials such as composites and RMGICs.

Conflict of interest: None

Several studies have evaluated the fluoride release, flexural strength, and compressive strength of Cention N. Although it is not classified as a composite, *in vitro* findings indicate that Cention N exhibits superior mechanical properties compared to conventional glass ionomer cement (GIC). However, composites are preferred more often due to their wider shade availability, which Cention N lacks. A more appropriate comparison is with RMGIC, as both materials allow bulk filling and curing.[4,5]

Kids-e-Restore is a resin-reinforced glass ionomer restorative that is self-adhesive, light-cured, flowable, and ready to use. By releasing fluoride, it enhances antibacterial and anti-inflammatory action, has self-adhesive technology, and does away with etching and bonding processes that require chemical adhesion. There

SYSTEMATIC REVIEW

Factors Affecting Success and Failure of Pulpectomy in Primary Teeth: A Systematic Review

Shrikant Bhujangrao Kendre[1], Anuja U Bhatane[2], Yogesh Jagannath Kale[3], Mahesh V Dadpe[4], Prasanna T Dahake[5]

Received on: 25 January 2025; *Accepted on:* 02 May 2025; *Published on:* 16 December 2025

Abstract

Aims and background: A pulpectomy in primary teeth is considered successful when there are no clinical symptoms or radiographic evidence of pathology. Outcomes vary due to multiple influencing factors, and comprehensive long-term evidence remains limited. This systematic review evaluates pulpectomy success over long-term follow-ups and identifies risk factors for failure.

Methods: An electronic database search was conducted in PubMed, EBSCOhost, Scopus, and Cochrane from January, 1990 to December 30, 2024. Different keywords were employed in various combinations during the search process to find all possible articles focused on our subject. The Cochrane risk of bias tool (ROB 2.0) was employed for evaluating randomized controlled trials, whereas observational studies were assessed using the ROBINS-I tool.

Results: A total of 360 articles were reviewed, and only 12 satisfied the inclusion requirements. The success rate of pulpectomy ranged between 38.5% and 96.2% over 5 years. The minimum amount of preoperative root resorption and adequate length of root canal filling material are the common factors associated with the success of pulpectomy. Zinc oxide eugenol (ZOE) and Endoflas success rate were 90% and 71% or less for iodoform after 18 months of evaluation.

Conclusion: Factors associated with the success of pulpectomy were an absence of preoperative periapical lesions, minimal preoperative root resorption, adequate root canal filling, and the type of postendodontic restoration. The factors associated with pulpectomy failure were the presence of a periapical lesion, preoperative swelling, fistula, pulpectomy performed in trauma cases, and inadequate quality of the root filling. Age, gender, tooth position, treatment modality, and number of appointments did not significantly affect pulpectomy.

Clinical significance: This systematic review holds significant clinical value as it enhances treatment predictability, minimizes failures, and supports the preservation of primary teeth, ultimately benefiting pediatric oral health.

Keywords: Clinical and radiographic evaluation, Factors, Longevity, Primary teeth, Pulpectomy, Success and failure, Survival rate.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3343

Introduction

Involvement of pulp due to caries or trauma in primary teeth leads to irreversible damage, causing degeneration or necrosis. To preserve such a tooth in the oral cavity to maintain function as well as arch integrity, an endodontic procedure like pulpectomy is indicated.[1] Following all the standard procedural protocols, the primary teeth are preserved in the oral cavity. To consider the procedure successful, the absence of signs and symptoms clinically and radiographically is considered as prime criteria.[2] Several studies and ongoing research have shown that pulpectomy has a better prognosis as a treatment modality. However, conclusive findings are still elusive. Success and failure can be determined by a wide range of possible factors that are inconsistent. The success rate can differ according to the preoperative findings, such as lesion etiology, type of lesion, type of filling materials, and the clinician's expertise. The failure was more likely to occur in patients with greater levels of gingivitis and visible plaque. Additionally, risk variables for failure were identified as the presence or absence of full coronal restoration.

The review on pulp treatment techniques for extensively decayed primary teeth published in Cochrane in 2018 had certain limitations that included both vital and nonvital pulp therapies without a focused analysis on pulpectomy procedures. Additionally, the included evidence was current only up to August, 2017, potentially omitting recent advancements in the area.[3] Another systematic review published in 2019 exclusively assessed the success of zinc oxide eugenol (ZOE) and calcium hydroxide-iodoform paste about the quality of obturation for pulpectomy procedures in primary teeth and did not evaluate the factors.[4]

A systematic review published in 2020 on randomized controlled trials assessed success rates for nonvital therapy in primary teeth and compared lesion sterilization and tissue repair (LSTR) with pulpectomy for a 6–12 months follow-up.[5] This paper, being a short-term evaluation, represents a significant limitation, contrary to more predictable long-term treatment success. Hence, an evident gap was found to exist in the last 4 years regarding substantial comparative papers for such findings.

[3,4] Professor & PG Guide, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

[5]Reader, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

Abstract:

Supernumerary teeth, also known as hyperdontia, refer to the presence of additional teeth beyond the normal dental count in the arch. The prevalence of supernumerary teeth in the anterior region is 2.2%, with mesiodens accounting for 78.4% of these cases. Mesiodens, the most common type of supernumerary teeth, can cause several complications, including spacing, crowding, eruption issues, and esthetic concerns. These anomalies are particularly significant during the primary and early mixed dentition stages, as they can lead to various dental problems such as speech difficulties, resorption of adjacent tooth roots, delayed eruption of permanent incisors, and the potential development of dentigerous cysts. Early identification and management of mesiodens are crucial to avoid further complications in permanent dentition. The current paper focuses on seven cases of mesiodens identified during the primary, mixed and permanent dentition phase, along with their effective management strategies.

Keywords: Mesiodens, Supernumerary tooth, Pediatric dentistry, Case reports

Corresponding Author: Dr. Mansi Bhakkad, Postgraduate Student, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur, Email – mansi.bhakkad1234@gmail.com

INTRODUCTION:

Supernumerary teeth are additional teeth that develop in the mouth and can affect the eruption and alignment of normal teeth.1 Mesiodens are the most common type of supernumerary teeth, typically found in the maxillary anterior region between the central incisors. The prevalence of supernumerary teeth is 0.15–1% in permanent dentition and 0.3–0.6% in the primary dentition with predilection of 2:1 for male sex.2 These teeth are often identified during routine dental examinations or as a result of complications such as delayed eruption, diastema, displacement of adjacent teeth, or root resorption.3 While mesiodens may remain asymptomatic, their presence near critical anatomical structures such as the nasal floor can pose diagnostic and surgical challenges. It can affect both maxilla and mandible; however, its occurrence in the mandible is rare.4 The most common type of supernumerary tooth as indicated by Alberti et al is mesiodens. Mesiodens may occur as single, multiple, unilateral or bilateral.5 The exact etiology of mesiodens tooth is not clearly known, though various theories have been suggested, including dichotomy of the tooth bud, hyperactivity of the dental lamina and combination of genetic-environmental factors. Single supernumerary teeth may be seen in association with conditions like cleft lip and/or palate, Downs syndromes, Cleidocranial dysplasia, etc.6 In some syndromes, mesiodens may present as a part of the

[3,4]Professor & PG Guide, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

[5]Reader, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

Abstract:

In order to save carious primary teeth until their natural exfoliation and retain the structure and function of the arch, pulpectomy is still a fundamental treatment in Pediatric dentistry. The mechanical and biological characteristics of the obturating substance utilized have a significant impact on the pulpectomy's long-term success. The conventional option of zinc oxide-eugenol (ZOE) has drawbacks such cytotoxicity and delayed resorption. The powerful antibacterial, anti-inflammatory, and healing-promoting qualities of zinc oxide-ozonated oil (ZnO-OO) have drawn attention recently. This review compares the performance of ZnO-OO with both established and novel materials, combining the recent data from four important in vivo investigations. ZnO-OO is an appealing option for juvenile endodontics because of its high clinical and radiographic success, remarkable biocompatibility, and exceptional handling qualities, as shown by consistent results.

Keywords: Narrative Review, Obturating Material, Pediatric Dentistry, Pulpectomy, Zinc Oxide Ozonated Oil

Corresponding Author: Dr. Kamesh Bhamare, Postgraduate Student, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur, Email – kameshbhamare@gmail.com

INTRODUCTION:

Mastication, phonation, aesthetics, and directing the emergence of permanent teeth are all critical functions of primary teeth. It is crucial to keep these teeth intact until their natural exfoliation, particularly if pulp diseases are present. Pulpectomy is recommended when primary teeth exhibit permanent pulpitis or necrosis. This procedure entails total debridement and obturation of the root canal system. The optimal obturating material should be radiopaque, biocompatible, resorbable, antibacterial, and easy to apply without interfering with succeeding eruption.

Because of its antibacterial properties and track record of dependability, zinc oxide-eugenol (ZOE) has been utilized extensively. Nevertheless, it may not resorb as quickly as primary roots and may remain in the periapical area, which may interfere with the permanent successors' eruptive route and result in periapical inflammation1. Furthermore, at high doses, the eugenol component is cytotoxic2,3,4. Alternative materials like calcium hydroxide, iodoform-based pastes (like Vitapex), herbal formulations, and biologically inspired combinations like 3Mix have been investigated as a result. Because of its biological qualities, which include antibacterial activity, debriding impact, angiogenesis promotion,

Evaluation of color stability, wear, and fracture resistance of preformed Bioflx and zirconia crowns: An *in vitro* study

Yogesh J. Kale, Niketa N. Deshmukh, Mahesh V. Dadpe, Prasanna T. Dahake, Shrikant B. Kendre

Department of Pediatric and Preventive Dentistry, MIDSR Dental College and Hospital, Latur, Maharashtra, India

ABSTRACT

Background: The ideal crowns for primary teeth should be esthetic, durable, and easy to place. Preformed zirconia crowns, although the most commonly used, esthetically pleasing, require significant tooth reduction, lack flexibility and adjustability, and cause wear of opposing teeth. Recently, new high-strength, medical-grade resin polymer preformed crowns have been introduced, promising to address these limitations. **Aim:** This *in vitro* study aimed to evaluate and compare the color stability, wear, and fracture resistance of newly introduced resin polymer crowns (Bioflx) with preformed zirconia crowns. **Materials and Methods:** Forty-eight extracted human primary molars were prepared, followed by the placement of Bioflx and zirconia crowns as per the respective study groups (n = 12). The samples were subjected to thermocycling and chewing simulations to mimic aging. Pre- and postaging color stability, wear, and fracture resistance values were assessed. The mean values were calculated and the data were subjected to the statistical analysis. **Results:** Bioflx crowns exhibited significantly higher color stability compared to zirconia crowns after aging ($P < 0.001$). Bioflx crowns exhibited less volumetric wear of crown material and antagonist teeth compared to zirconia crowns ($P < 0.05$). Regarding fracture resistance, Bioflx crowns maintained their strength after aging ($P > 0.05$), whereas zirconia crowns experienced a highly significant decline in strength after aging ($P \leq 0.001$). **Conclusion:** Bioflx crowns offer a promising alternative in restorative pediatric dentistry. They demonstrate superior color stability and wear resistance and maintain adequate fracture strength following aging. Further clinical studies are warranted to validate these results and explore their broader applicability.

Introduction

Selecting an ideal crown for the restoration of grossly decayed teeth is challenging.[1] In pediatric dentistry, various crowns are used to restore decayed, damaged, and endodontically treated teeth, each with specific benefits and limitations.[2] Stainless steel crowns (SSCs) are highly durable, cost-effective, and resistant to wear, making them ideal for primary molars, especially in children with high caries risk or those requiring a pulpotomy or pulpectomy.[3-5] However, their metallic appearance makes them unsuitable for anterior teeth.

Assessment of Detrimental Effects of Pediatric Drug Syrups on Different Esthetic Dental Restorative Materials Used in Children: A Systematic Review

Yogesh J Kale[1], Sonali D Lingayat[2], Mahesh V Dadpe[3], Prasanna T Dahake[4], Shrikant B Kendre[5]

Received on: 12 April 2025; *Accepted on:* 16 May 2025; *Published on:* 20 June 2025

Abstract

Aim and background: Studying the effects of pediatric drugs on esthetic dental restorative materials reflects the complex interactions between pediatric oral liquid medications and restorative materials. This systematic review summarizes and assesses the adverse effects of various pediatric drug syrups on different esthetic dental restorative materials used in children by reviewing the available literature.

Methods: The assessment was conducted under the Preferred Reporting Items for Systematic Reviews and Meta-Analysis Protocols (PRISMA-P) guidelines and was officially registered on the International Prospective Register of Systematic Reviews (PROSPERO) (CRD42024499625). An extensive search of electronic databases was conducted covering the period from 1990 to December 2024 to gather articles containing relevant data. Assessment of effects on color stability and surface properties of different esthetic restorative materials was carried out followed by the quality assessment of the selected studies using the QUIN RoB tool.

Results: Eighteen studies included in this systematic review analyzed the effects of pediatric liquid medications on esthetic dental restorative materials such as glass ionomer cements (GICs); composites; and their modifications with regard to liquid medicines such as antibiotics, analgesics, antiepileptic drugs, iron supplements, and multivitamins. Composites and modified GICs demonstrated higher susceptibility to syrup-induced damage compared to traditional GICs, which show better resistance. The *in vitro* studies in this review showed a definite risk of discoloration and increased surface roughness associated with chronic use of many pediatric drug syrups.

Conclusion: Composites and modified GICs demonstrated more vulnerability to syrup-induced detrimental effects compared to traditional GICs. Most of the drug syrups used in children demonstrated the risk of discoloration and increased surface roughness, particularly those with acidic components, pigmenting agents, and high sugar content. Further research is needed to explore specific interactions between the specific liquid drugs and different esthetic dental restorative materials responsible for these effects. Also, research should focus on conducting *in vivo* and long-term studies with standardized assessment protocols.

Clinical significance: Healthcare providers should be aware of the potential effects of liquid medications on dental restorative materials. By integrating this knowledge into clinical practice, healthcare professionals can contribute to the provision of good oral health in pediatric patients.

Keywords: Color stability, Dental restorative materials, Pediatric liquid medications, Surface roughness.

World Journal of Dentistry (2025): 10.5005/jp-journals-10015-2631

Introduction

Pediatric dentists have always been confronted with the problem of replacing a missing tooth or a part of the tooth structure with artificial restorative materials while maintaining esthetics and function. The demand for natural appearance by children and parents has prompted studies to create esthetically pleasing dental materials that resemble natural teeth.[1] These restorative materials can restore cavitated esthetic areas in both anterior and posterior dentition, facilitating the rehabilitation of flawed teeth.[2] Primary teeth are generally restored using glass ionomer cement (GIC), composites, compomers, and their modifications according to the appropriate recommendations based on the particular needs of the children.[3–5] Though these materials are preferred due to their favorable esthetics and compatibility with the oral environment, they differ significantly in their color stability and susceptibility to staining upon their interaction with the oral environment and exposure to various substances.[2]

Staining or lack of color stability is a major issue that arises in all restorative materials over time and is caused by both internal and external factors. Intrinsic color changes can be influenced by a variety of factors, such as the composition of the matrix, the size, and ratio of the filler particles; inadequate polymerization; and surface roughness of the materials. The extrinsic factors include frequent consumption of acid-containing drinks, beverages, food, and acidic medicines with coloring agents/additives.[6–9] Among these, pediatric liquid medications/drug syrups are a common but often overlooked factor that may impact the physical and chemical properties of the restorative materials.

ABSTRACT

Background: The goal of this study was to assess the techniques used in earlier conducted clinical investigations on the chemomechanical eradication of dentinal caries, as well as to assess the variances in pain perception, the time required for complete caries excavation, and how microbiological analysis compared before and following caries removal in primary teeth for both Papacarie and Carisolv. **Materials and Methods:** An electronic search was conducted utilizing the databases PubMed, Google Scholar, EBSCOhost, Scopus, and the Cochrane Library. The following categories were included during the assessment process: full text randomized and controlled clinical trials published between January 2000 and December 2021 in the English language only. Adolescent and child patients with open dentinal carious lesion in primary teeth were included. The methodology of the seven clinical studies chosen was evaluated. **Results:** Findings of the study reported that the microbiota in carious dentine was dramatically reduced with the Papacarie therapy, and the pain perception decreased more in the Papacarie group, whereas Carisolv treatment took longer time for complete caries excavation as compared to Papacarie. **Conclusion:** In conclusion, Papacarie had a beneficial impact by decreasing pain and time taken during caries excavation in primary teeth. The tooth surface treated with Papacarie also demonstrated a reduced bacterial count as compared to Carisolv chemomechanical caries removal approach. Overall, Papacarie and Carisolv are viable minimally invasive and painless techniques for effective caries removal in pediatric patients.

Key Words: Caries excavation, dental caries, dentin, lactobacilli colony count, primary teeth, *Streptococcus mutans*

INTRODUCTION

The term "caries excavation" is defined as mechanical treatment of dental caries-induced tooth damage to best fit the remaining parts of the tooth to receive a filling.[1] Ogushi and Fusayama have demonstrated the two zones within a carious lesion. An inner layer of intact collagen (affected dentin) and a second zone with partially destroyed collagen fibrils that cannot be remineralized (infected dentin).[2] Dental researchers worldwide though are

Comparative evaluation of antibacterial efficacy of sequential herbal irrigation with conventional irrigation in endodontic therapy of primary teeth: A randomized controlled trial

Shrikant Bhujangrao Kendre, Anuja U. Bhatane, Mahesh Vilasrao Dadpe, Yogesh Jagannath Kale, Prasanna Trambakrao Dahake

Department of Pediatric and Preventive Dentistry, MIDSR Dental College and Hospital, Latur, Maharashtra, India

ABSTRACT

Background: Successful endodontic therapy in primary teeth relies on effective microbial control. Although conventional irrigants are effective, they pose risks such as cytotoxicity, unpleasant taste, and tissue irritation. Herbal alternatives offer a safer, biocompatible option, especially suitable for children. **Aims:** To evaluate and compare the antimicrobial efficacy of a sequential herbal irrigation protocol with a conventional irrigation protocol in the endodontic treatment of primary teeth. **Materials and Methods:** It is a split-mouth, double-blind, and randomized controlled trial that included 15 pediatric patients aged 4–8 years with bilateral primary molars indicated for pulpectomy. Group I received conventional irrigation with 3% sodium hypochlorite, 17% ethylenediaminetetraacetic acid, and 2% chlorhexidine. Group II underwent sequential herbal irrigation using ethanolic extracts of 12.5% *Salvadora persica* (Miswak), 20% *Azadirachta indica* (Neem), 2% tea tree oil, and 10% phytic acid. Pre and postirrigation microbial samples were collected and cultured to quantify *Enterococcus faecalis* and *Prevotella intermedia*. Statistical analysis used paired *t*-tests for intragroup comparisons and one-way analysis of variance for intergroup differences, with significance set at $P < 0.05$. **Results:** Both groups showed significant microbial reduction ($P < 0.0001$). Group I had 90.54% and 87.6% reductions in *E. faecalis* and *P. intermedia*, respectively, while Group II achieved 92.2% and 90.54%. Herbal irrigation showed significantly greater *E. faecalis* reduction ($P = 0.025$), but *P. intermedia* reduction was not significant ($P = 0.384$). **Conclusions:** The sequential herbal irrigation protocol showed comparable antimicrobial efficacy to conventional agents, with added benefits of safety, biocompatibility, and reduced cytotoxicity, making it a promising natural alternative in pediatric endodontics.

The Combination of Biomimetic Materials Enhances the Functional Differentiation of Stem Cells Exfoliated from Human Deciduous Teeth

Prasanna T Dahake[1], Shruti Bhamare[2], Yogesh Jagannath Kale[3], Mahesh V Dadpe[4], Shrikant Bhujangrao Kendre[5], Dilip Duryodhan Ghadage[6], Vijay M Kumbar[7]

Received on: 01 December 2024; *Accepted on:* 22 December 2024; *Published on:* 04 September 2025

Abstract

Introduction: Stem cell therapy has been used in a variety of clinical procedures. When introduced into a specific part of the body, these cells differentiate into a target cell type and help replace damaged tissue and improve function. This experimental study was conducted to evaluate the effect of combining various natural biomimetic materials on stem cells from human exfoliated deciduous teeth (SHED).

Materials and methods: After isolation and culturing of SHED to the fifth passage, cells were treated with a regular culture medium (Group I–negative control), osteoinduction medium (Group II–positive control), a combination of mineral trioxide aggregate plus coral (MC, group III), and a combination of Biodentine plus coral (BC, group IV). Viability was assessed using MTT assay on the 7th, 14th, and 21st days. Mineralization was evaluated by Alizarin Red S staining to detect calcium deposits at the same intervals. The anti-inflammatory potential for expression of MMP-9 and MMP-2 was analyzed using gelatin zymography. One-way ANOVA followed by *post hoc* Bonferroni test was applied for statistical comparison ($p < 0.05$).

Results: MC showed better cell viability than BC on the 14th and 21st days. However, BC demonstrated significantly better cytodifferentiation potential ($p < 0.001$) and anti-inflammatory effect ($p < 0.001$) than MC.

Conclusion: With the addition of coral, the properties of both commercially available biomimetic materials were enhanced, resulting in improved osteoinductive properties of mineral trioxide aggregate and Biodentine. The MC combination showed better cell viability and proliferation, while BC showed superior cytodifferentiation and anti-inflammatory properties. Coral, as a natural material, enhanced both formulations significantly.

Keywords: Anti-inflammatory, Biodentine, Coral, Mineral trioxide aggregate, Stem cells from human exfoliated deciduous teeth, Vital pulp therapy.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3192

Introduction

Regenerative endodontic procedures have provided alternative treatment modalities to traditional treatment options for young permanent teeth. Stem cell therapy has been used in a variety of clinical procedures.[1] Pulp tissue harbors dental progenitor cells, opening the gateway to possible therapeutic modalities to preserve the dentin–pulp complex.[2] Vital pulp therapies and pulpotomy are the most commonly used therapeutic modalities to preserve maximum dental tissue in primary and young permanent teeth. In addition, dental materials that maintain or encourage the vitality of the pulp are known as biomimetic materials and are preferred in regenerative endodontics.[3,4]

Test materials used in the present study, such as mineral trioxide aggregate (MTA) and Biodentine, are considered biomimetic materials.[5] MTA has unique stability and excellent sealing properties, along with antimicrobial effects and biocompatibility with native tissues.[6] One study demonstrated proliferation and differentiation of murine homogeneous pulp cells into odontoblast-like cells after contact with MTA, which later demonstrated adhesion, propagation, and relocation of human mesenchymal stem cells (HMSC) or stem cells from human exfoliated deciduous teeth (SHED).[7] It has demonstrated better mineralization potential and minimal inflammation in pulp tissues during clinical use, making it the most preferred material during dental treatments.[3] The main drawbacks of MTA are discoloration, prolonged setting time, and difficulty in removing the material after setting.[8]

Biodentine was first introduced in 2009 due to its several advantages over MTA.[9] Biodentine™ (Septodont, Saint-Maur-des-Fossés, Cedex, France) is frequently used in endodontic therapies and restorative procedures to regenerate tissues of the pulp–

Comparative Evaluation of Thermal Effects, Cleaning Efficacy, and Dentinal Defects of Three Rotary Systems in Primary Teeth: *In Vitro* Study

Shrikant B Kendre[1], Anuja U Bhatane[2], Yogesh J Kale[3], Mahesh V Dadpe[4], Prasanna T Dahake[5]

Received on: 04 September 2025; *Accepted on:* 14 October 2025; *Published on:* xxxx

Abstract

Aim: To compare and assess heat generation during instrumentation, debridement efficacy, and root defects caused by three nickel-titanium (Ni-Ti) rotary systems in primary teeth.

Materials and methods: Sixty-four extracted human primary molars were selected and randomly divided into four groups for cleaning and shaping ($n = 16$). Group I: hand K files, group II: Kedo-S2, group III: Kids-e-files, and group IV: Prime Pedo™ rotary system. During instrumentation, teeth in alginate-filled Eppendorf tubes were placed in a water bath with thermocouples connected at the apical and middle thirds for recording temperature changes. Postinstrumentation, teeth were sectioned for debris and defect analysis under the stereomicroscope. Data were recorded and statistically analyzed.

Results: The mean temperature rise at the middle and apical third for groups I, II, III, and IV was 0.48, 1.85, 2.20, 2.26°C, and 0.73, 3.01, 3.06, 2.85°C, respectively. Mean debris scores for groups I, II, III, and IV were 3, 2, 1.6, and 1.7, respectively. Group II had the most dentinal cracks in the coronal third (mean = 1.42), followed by group IV (mean = 1.28). Group I revealed significant differences ($p < 0.01$) in comparison with II, III, and IV.

Conclusion: All three Ni-Ti rotary systems showed temperature elevations well below the threshold level, preventing harmful thermal effects, and demonstrated superior cleaning and minimal defects, with Prime Pedo™ showing the highest efficacy.

Clinical significance: This study guides the clinician in selecting pediatric rotary systems that are more efficient than manual instrumentation, reducing operative time while maintaining minimal thermal risks and dentinal damage.

Keywords: Dentinal defects, Pediatric rotary files, Primary teeth, Root canal cleaning ability, Thermocouple.

World Journal of Dentistry (2025): 10.5005/jp-journals-10015-2718

Introduction

Preserving primary teeth through effective endodontic treatment is crucial for maintaining space, function, and esthetics in growing children.[1] However, the complex, ribbon-shaped root canals of primary molars pose significant challenges for achieving a three-dimensional seal. Traditional hand instrumentation, though reliable, is time-consuming and prone to iatrogenic errors such as canal transportation and ledging.[2] Pediatric rotary nickel-titanium (Ni-Ti) systems have emerged as a faster, more efficient alternative, revolutionizing pediatric endodontics since their introduction by Barr et al.[3]

Recent advancements have led to the development of exclusive pediatric rotary files, such as the Kedo-S2, Kids-e-files, and Prime Pedo™ systems, each with unique design features. The Kedo-S2 file, a fourth-generation system, incorporates a dual-core Ni-Ti alloy with a variable cross-section—triangular apically for minimal dentin removal and teardrop-shaped coronally for efficient debris clearance.[4] Kids-e-files are advanced heat-treated rainbow rotary files. They have CM wire Ni-Ti memory alloy, which increases flexibility and resistance to cyclic fatigue. The triangular cross-section with a 4% constant taper keeps the center stiffness and high cutting efficiency. The Prime Pedo file system consists of three files (starter, P1, P2). They are gold-treated and have triangular cross-sections—the starter file with 8% taper and P1 and P2 with 6% taper.[5] These systems operate at low speeds (250–300 rpm), reducing procedural risks while improving efficacy.[5]

Source of support: Nil

Conflict of interest: None

However, concerns remain regarding heat generation during instrumentation, which can potentially damage surrounding periodontal tissues. Studies indicate that temperatures exceeding 47°C risk irreversible bone resorption, emphasizing the need for thermal safety assessments.[6] Additionally, rotary instrumentation may induce dentinal defects such as microcracks, compromising root structural integrity. The varying designs, tapers, and kinematics of different Ni-Ti systems further complicate their clinical predictability.[7]

Considering these factors, this study aims to compare and assess heat generation during instrumentation, debridement efficacy, and root defects caused by three Ni-Ti rotary systems

Adverse Effects of Paediatric Liquid Medications on Primary Teeth: A Systematic Review

NIKETA N DESHMUKH[1], YOGESH J KALE[2], MAHESH V DADPE[3], PRASANNA T DAHAKE[4], SHRIKANT B KENDRE[5]

(cc) BY-NC-ND

ABSTRACT

Introduction: Paediatric liquid medications are widely administered due to their ease of use and high compliance. Emerging evidence, however, suggests these formulations may have unintended oral health consequences. Specifically, the primary dentition may experience erosion, discolouration, and altered surface properties. Studying the adverse effects of different paediatric liquid medications on primary teeth reflects a growing understanding of the complex interactions between medications and dental health and ongoing efforts to mitigate potential risks to children's oral health.

Aim: The present systematic review was conducted to summarise and assess the effects of various paediatric drugs on primary teeth by reviewing the available literature.

Materials and Methods: The present systematic review was conducted in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Protocols (PRISMA-P) guidelines and was registered on PROSPERO (CRD42023413689). The PROSPERO record is available at https://www.crd.york.ac.uk/prospero/display_record.php?ID=CRD42023413689. An extensive search of electronic databases was conducted covering January 2000 to December 2023 to identify studies reporting adverse effects of paediatric drugs on primary teeth. Quality assessment of the included studies was performed using the Quality Assessment Tool For In Vitro Studies (QUIN) tool.

Results: After meeting the eligibility criteria 24 in-vitro studies were included. Each study analysed the effects of medications on primary teeth. Enamel erosion, increased surface roughness, and discolouration were observed with most paediatric liquid medications.

Conclusion: This systematic review, included 24 studies, demonstrated associations between paediatric liquid medications and deleterious effects on the primary dentition. These adverse effects are likely driven by the acidic components, colouring additives, and prolonged contact time of the formulations. Despite methodological variations among studies, the consistent findings across different medication classes reinforce these conclusions. By integrating this knowledge into clinical practice, healthcare professionals can contribute to the promotion of optimal oral health in paediatric patients.

Keywords: Dental caries, Dental erosion, Discolouration, Enamel loss

INTRODUCTION

Doctors recommend medications to address various health concerns [1]. The various routes of drug administration are oral, nasal, sublingual, cutaneous, parenteral, and rectal [2]. Among these, the oldest, most common, and easiest administration route is the oral route [3]. Oral drugs, such as capsules, are coated to mask unpleasant tastes and are inappropriate for use in children due to their inability to swallow them at a young age [4]. Therefore, medication in liquid form is recommended for them. Both parents and children find them easily obtainable and highly acceptable [5]. In paediatric medicine, syrups have been used for an extensive period. Their use is typically for a shorter period, but it may be a regular occurrence for some children [5]. Long-term use of sugary liquid medications increases the risk of cavities. While parents know sugar causes decay, they often overlook medications as a sugar source. Children taking medications for chronic or recurring illnesses, and even supplements, are at risk of dental caries [6,7].

Analysis of drug properties revealed that pH, viscosity, acidity, and sugar content contribute to adverse dental effects such as erosion, staining, and hypoplasia [5,8]. Studies show that children using long-term, sugar-containing medications have a higher rate of caries than those not taking such medications [8-11].

Dental erosion, defined as irreversible tooth loss from acid (not bacteria), has external and internal causes. Internal causes include stomach acid contact with the tooth, as in GERD. Extrinsic sources of dental erosion include excessive consumption of acid-containing drinks, beverages, foods, and acidic medicines [6]. A drug's erosive potential depends on its titratable acidity, pH, and pKa. Acidic formulations are often needed for effective dispersal, reactions, stability, compatibility, and taste [7,12]. Frequent ingestion (more than twice daily), night time or between-meal consumption, high viscosity, and reduced saliva flow can increase medication-induced dental erosion [1,13,14].

Certain in vitro studies have shown that drugs may disrupt the structure and hardness of enamel [12,14]. However, the literature lacks research examining how medications affect primary tooth enamel, and the results of these investigations are restricted to a limited number of drugs [15]. According to some authors [5,8], the difference in erosion between primary and permanent teeth is due to differences in their morphology. Nevertheless, there is still debate regarding the vulnerability of primary teeth to both caries and erosion compared to permanent teeth [14].

To address the lack of thorough research on paediatric medication effects on primary teeth, a systematic literature review was conducted to summarise and evaluate these effects.

MATERIALS AND METHODS

This review was conducted in compliance with the Preferred Reporting Items for Systematic Review and Meta-Analysis Protocols (PRISMA-P) statement. An extensive search of electronic databases was conducted covering January 2000 to December 2023.

Data Items

The aim of this review was to assess the effect of various paediatric liquid medications on primary teeth. The research question in PICOS format was: "What are the adverse effects of various paediatric

Comparative Evaluation of Shear Bond Strength and Microleakage of Three Different Restorative Materials in Primary Molar Teeth: An *In Vitro* Study

Mahesh V Dadpe[1], Umesh R Kendre[2], Yogesh J Kale[3], Prasanna T Dahake[4], Shrikant B Kendre[5]

Received on: 21 February 2025; *Accepted on:* 29 April 2025; *Published on:* 17 November 2025

Abstract

Background: In minimally invasive dentistry, adhesive restorative materials are widely used both as bulk restoratives and for the repair of occlusal, proximal, cervical, and multisurface cavities. These consist of conventional, modified glass ionomers, compomers, composites, and new alkasite materials. Few investigations have focused on comparing the *in vitro* behavior of recently developed restorative materials.

Aim: To compare and assess the microleakage and shear bond strength (SBS) of 3M ESPE Composite (Filtek Z350 XT), Kids-e-Restore, and Cention N in primary molar teeth.

Materials and methods: This experimental investigation was divided into three groups: Cention N was in group I, Kids-e-Restore was in group II, and 3M ESPE composite (Filtek Z350 XT) was in group III. Shear bond strength testing was done by a universal testing machine. The maximum load was recorded during the testing. Samples were analyzed through a stereomicroscope to evaluate bond failure mode. Dye penetration was used to assess microleakage, and a stereomicroscope was used for examination.

Results: 3M Filtek Z350XT had the highest SBS, and Cention N had the lowest. Kids-e-Restore showed the least amount of microleakage, then by Cention N and 3M Filtek Z350 XT.

Conclusion: Composite resin (3M Filtek Z350 XT) has better SBS than Cention N and flowable GIC (glass ionomer cement) (Kids-e-Restore) in primary molar teeth. Flowable GIC (Kids-e-Restore) showed less microleakage and is a good adjunct for class II restorations.

Keywords: Cention N, Filtek Z350 XT, Kids-e-Restore, Microleakage, Shear bond strength.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3313

Introduction

In the era of minimally invasive dentistry, adhesive restorative materials are extensively used both as bulk restorative options and for repairing occlusal, proximal, cervical, and multisurface cavities. These consist of composites, compomers, modified glass ionomers, and conventional glass ionomers.[1] An ideal restorative material should have a number of qualities, including excellent wear resistance, minimal water absorption, no microleakage, strong shear bond strength (SBS), biocompatibility, and good compressive, flexural, and tensile strength. Because of their superior mechanical qualities, resin-modified glass ionomer cements (RMGICs) and composites are regarded as better than other materials.[2]

Furthermore, composites and RMGICs also exhibit anticariogenic and fluoride-releasing properties. Within the category of adhesive restorative materials, Cention N is a novel alkasite substance. It has an alkaline filler that helps control pH and releases acid-neutralizing ions in acidic environments, preventing dental cavities. Additionally, it releases calcium and fluoride, which can help remineralize early enamel defects.[3] The monomer matrix of this novel bioactive material consists of different urethane dimethacrylates (UDMA), including UDMA, dicarbonyl dimethacrylate (DCP), polyethylene glycol 400 dimethacrylate (PEG-400 DMA), and an aromatic aliphatic component.

According to manufacturers, the material Cention N is sophisticated and has good mechanical properties that can compete with established, tried-and-true esthetic adhesive materials such as composites and RMGICs.

Source of support: Nil

Conflict of interest: None

Several studies have evaluated the fluoride release, flexural strength, and compressive strength of Cention N. Although it is not classified as a composite, *in vitro* findings indicate that Cention N exhibits superior mechanical properties compared to conventional glass ionomer cement (GIC). However, composites are preferred more often due to their wider shade availability, which Cention N lacks. A more appropriate comparison is with RMGIC, as both materials allow bulk filling and curing.[4,5]

Kids-e-Restore is a resin-reinforced glass ionomer restorative that is self-adhesive, light-cured, flowable, and ready to use. By releasing fluoride, it enhances antibacterial and anti-inflammatory action, has self-adhesive technology, and does away with etching and bonding processes that require chemical adhesion. There

SYSTEMATIC REVIEW

Factors Affecting Success and Failure of Pulpectomy in Primary Teeth: A Systematic Review

Shrikant Bhujangrao Kendre[1], Anuja U Bhatane[2], Yogesh Jagannath Kale[3], Mahesh V Dadpe[4], Prasanna T Dahake[5]

Received on: 25 January 2025; *Accepted on:* 02 May 2025; *Published on:* 16 December 2025

Abstract

Aims and background: A pulpectomy in primary teeth is considered successful when there are no clinical symptoms or radiographic evidence of pathology. Outcomes vary due to multiple influencing factors, and comprehensive long-term evidence remains limited. This systematic review evaluates pulpectomy success over long-term follow-ups and identifies risk factors for failure.

Methods: An electronic database search was conducted in PubMed, EBSCOhost, Scopus, and Cochrane from January, 1990 to December 30, 2024. Different keywords were employed in various combinations during the search process to find all possible articles focused on our subject. The Cochrane risk of bias tool (ROB 2.0) was employed for evaluating randomized controlled trials, whereas observational studies were assessed using the ROBINS-I tool.

Results: A total of 360 articles were reviewed, and only 12 satisfied the inclusion requirements. The success rate of pulpectomy ranged between 38.5% and 96.2% over 5 years. The minimum amount of preoperative root resorption and adequate length of root canal filling material are the common factors associated with the success of pulpectomy. Zinc oxide eugenol (ZOE) and Endoflas success rate were 90% and 71% or less for iodoform after 18 months of evaluation.

Conclusion: Factors associated with the success of pulpectomy were an absence of preoperative periapical lesions, minimal preoperative root resorption, adequate root canal filling, and the type of postendodontic restoration. The factors associated with pulpectomy failure were the presence of a periapical lesion, preoperative swelling, fistula, pulpectomy performed in trauma cases, and inadequate quality of the root filling. Age, gender, tooth position, treatment modality, and number of appointments did not significantly affect pulpectomy.

Clinical significance: This systematic review holds significant clinical value as it enhances treatment predictability, minimizes failures, and supports the preservation of primary teeth, ultimately benefiting pediatric oral health.

Keywords: Clinical and radiographic evaluation, Factors, Longevity, Primary teeth, Pulpectomy, Success and failure, Survival rate.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3343

Introduction

Involvement of pulp due to caries or trauma in primary teeth leads to irreversible damage, causing degeneration or necrosis. To preserve such a tooth in the oral cavity to maintain function as well as arch integrity, an endodontic procedure like pulpectomy is indicated.[1] Following all the standard procedural protocols, the primary teeth are preserved in the oral cavity. To consider the procedure successful, the absence of signs and symptoms clinically and radiographically is considered as prime criteria.[2] Several studies and ongoing research have shown that pulpectomy has a better prognosis as a treatment modality. However, conclusive findings are still elusive. Success and failure can be determined by a wide range of possible factors that are inconsistent. The success rate can differ according to the preoperative findings, such as lesion etiology, type of lesion, type of filling materials, and the clinician's expertise. The failure was more likely to occur in patients with greater levels of gingivitis and visible plaque. Additionally, risk variables for failure were identified as the presence or absence of full coronal restoration.

The review on pulp treatment techniques for extensively decayed primary teeth published in Cochrane in 2018 had certain limitations that included both vital and nonvital pulp therapies without a focused analysis on pulpectomy procedures. Additionally, the included evidence was current only up to August, 2017, potentially omitting recent advancements in the area.[3] Another systematic review published in 2019 exclusively assessed the success of zinc oxide eugenol (ZOE) and calcium hydroxide-iodoform paste about the quality of obturation for pulpectomy procedures in primary teeth and did not evaluate the factors.[4]

A systematic review published in 2020 on randomized controlled trials assessed success rates for nonvital therapy in primary teeth and compared lesion sterilization and tissue repair (LSTR) with pulpectomy for a 6–12 months follow-up.[5] This paper, being a short-term evaluation, represents a significant limitation, contrary to more predictable long-term treatment success. Hence, an evident gap was found to exist in the last 4 years regarding substantial comparative papers for such findings.

Abstract:

Supernumerary teeth, also known as hyperdontia, refer to the presence of additional teeth beyond the normal dental count in the arch. The prevalence of supernumerary teeth in the anterior region is 2.2%, with mesiodens accounting for 78.4% of these cases. Mesiodens, the most common type of supernumerary teeth, can cause several complications, including spacing, crowding, eruption issues, and esthetic concerns. These anomalies are particularly significant during the primary and early mixed dentition stages, as they can lead to various dental problems such as speech difficulties, resorption of adjacent tooth roots, delayed eruption of permanent incisors, and the potential development of dentigerous cysts. Early identification and management of mesiodens are crucial to avoid further complications in permanent dentition. The current paper focuses on seven cases of mesiodens identified during the primary, mixed and permanent dentition phase, along with their effective management strategies.

Keywords: Mesiodens, Supernumerary tooth, Pediatric dentistry, Case reports

INTRODUCTION:

Supernumerary teeth are additional teeth that develop in the mouth and can affect the eruption and alignment of normal teeth.1 Mesiodens are the most common type of supernumerary teeth, typically found in the maxillary anterior region between the central incisors. The prevalence of supernumerary teeth is 0.15–1% in permanent dentition and 0.3–0.6% in the primary dentition with predilection of 2:1 for male sex.2 These teeth are often identified during routine dental examinations or as a result of complications such as delayed eruption, diastema, displacement of adjacent teeth, or root resorption.3 While mesiodens may remain asymptomatic, their presence near critical anatomical structures such as the nasal floor can pose diagnostic and surgical challenges. It can affect both maxilla and mandible; however, its occurrence in the mandible is rare.4 The most common type of supernumerary tooth as indicated by Alberti et al is mesiodens. Mesiodens may occur as single, multiple, unilateral or bilateral.5 The exact etiology of mesiodens tooth is not clearly known, though various theories have been suggested, including dichotomy of the tooth bud, hyperactivity of the dental lamina and combination of genetic-environmental factors. Single supernumerary teeth may be seen in association with conditions like cleft lip and/or palate, Downs syndromes, Cleidocranial dysplasia, etc.6 In some syndromes, mesiodens may present as a part of the

Abstract:

In order to save carious primary teeth until their natural exfoliation and retain the structure and function of the arch, pulpectomy is still a fundamental treatment in Pediatric dentistry. The mechanical and biological characteristics of the obturating substance utilized have a significant impact on the pulpectomy's long-term success. The conventional option of zinc oxide-eugenol (ZOE) has drawbacks such cytotoxicity and delayed resorption. The powerful antibacterial, anti-inflammatory, and healing-promoting qualities of zinc oxide-ozonated oil (ZnO-OO) have drawn attention recently. This review compares the performance of ZnO-OO with both established and novel materials, combining the recent data from four important in vivo investigations. ZnO-OO is an appealing option for juvenile endodontics because of its high clinical and radiographic success, remarkable biocompatibility, and exceptional handling qualities, as shown by consistent results.

INTRODUCTION:

Mastication, phonation, aesthetics, and directing the emergence of permanent teeth are all critical functions of primary teeth. It is crucial to keep these teeth intact until their natural exfoliation, particularly if pulp diseases are present. Pulpectomy is recommended when primary teeth exhibit permanent pulpitis or necrosis. This procedure entails total debridement and obturation of the root canal system. The optimal obturating material should be radiopaque, biocompatible, resorbable, antibacterial, and easy to apply without interfering with succeeding eruption.

Because of its antibacterial properties and track record of dependability, zinc oxide-eugenol (ZOE) has been utilized extensively. Nevertheless, it may not resorb as quickly as primary roots and may remain in the periapical area, which may interfere with the permanent successors' eruptive route and result in periapical inflammation1. Furthermore, at high doses, the eugenol component is cytotoxic2,3,4. Alternative materials like calcium hydroxide, iodoform-based pastes (like Vitapex), herbal formulations, and biologically inspired combinations like 3Mix have been investigated as a result. Because of its biological qualities, which include antibacterial activity, debriding impact, angiogenesis promotion,

Evaluation of color stability, wear, and fracture resistance of preformed Bioflx and zirconia crowns: An *in vitro* study

Yogesh J. Kale, Niketa N. Deshmukh, Mahesh V. Dadpe, Prasanna T. Dahake, Shrikant B. Kendre

Department of Pediatric and Preventive Dentistry, MIDSR Dental College and Hospital, Latur, Maharashtra, India

ABSTRACT

Background: The ideal crowns for primary teeth should be esthetic, durable, and easy to place. Preformed zirconia crowns, although the most commonly used, esthetically pleasing, require significant tooth reduction, lack flexibility and adjustability, and cause wear of opposing teeth. Recently, new high-strength, medical-grade resin polymer preformed crowns have been introduced, promising to address these limitations. **Aim:** This *in vitro* study aimed to evaluate and compare the color stability, wear, and fracture resistance of newly introduced resin polymer crowns (Bioflx) with preformed zirconia crowns. **Materials and Methods:** Forty-eight extracted human primary molars were prepared, followed by the placement of Bioflx and zirconia crowns as per the respective study groups (n = 12). The samples were subjected to thermocycling and chewing simulations to mimic aging. Pre- and postaging color stability, wear, and fracture resistance values were assessed. The mean values were calculated and the data were subjected to the statistical analysis. **Results:** Bioflx crowns exhibited significantly higher color stability compared to zirconia crowns after aging ($P < 0.001$). Bioflx crowns exhibited less volumetric wear of crown material and antagonist teeth compared to zirconia crowns ($P < 0.05$). Regarding fracture resistance, Bioflx crowns maintained their strength after aging ($P > 0.05$), whereas zirconia crowns experienced a highly significant decline in strength after aging ($P \leq 0.001$). **Conclusion:** Bioflx crowns offer a promising alternative in restorative pediatric dentistry. They demonstrate superior color stability and wear resistance and maintain adequate fracture strength following aging. Further clinical studies are warranted to validate these results and explore their broader applicability.

Introduction

Selecting an ideal crown for the restoration of grossly decayed teeth is challenging.[1] In pediatric dentistry, various crowns are used to restore decayed, damaged, and endodontically treated teeth, each with specific benefits and limitations.[2] Stainless steel crowns (SSCs) are highly durable, cost-effective, and resistant to wear, making them ideal for primary molars, especially in children with high caries risk or those requiring a pulpotomy or pulpectomy.[3-5] However, their metallic appearance makes them unsuitable for anterior teeth.

Assessment of Detrimental Effects of Pediatric Drug Syrups on Different Esthetic Dental Restorative Materials Used in Children: A Systematic Review

Yogesh J Kale[1], Sonali D Lingayat[2], Mahesh V Dadpe[3], Prasanna T Dahake[4], Shrikant B Kendre[5]

Received on: 12 April 2025; *Accepted on:* 16 May 2025; *Published on:* 20 June 2025

Abstract

Aim and background: Studying the effects of pediatric drugs on esthetic dental restorative materials reflects the complex interactions between pediatric oral liquid medications and restorative materials. This systematic review summarizes and assesses the adverse effects of various pediatric drug syrups on different esthetic dental restorative materials used in children by reviewing the available literature.

Methods: The assessment was conducted under the Preferred Reporting Items for Systematic Reviews and Meta-Analysis Protocols (PRISMA-P) guidelines and was officially registered on the International Prospective Register of Systematic Reviews (PROSPERO) (CRD42024499625). An extensive search of electronic databases was conducted covering the period from 1990 to December 2024 to gather articles containing relevant data. Assessment of effects on color stability and surface properties of different esthetic restorative materials was carried out followed by the quality assessment of the selected studies using the QUIN RoB tool.

Results: Eighteen studies included in this systematic review analyzed the effects of pediatric liquid medications on esthetic dental restorative materials such as glass ionomer cements (GICs); composites; and their modifications with regard to liquid medicines such as antibiotics, analgesics, antiepileptic drugs, iron supplements, and multivitamins. Composites and modified GICs demonstrated higher susceptibility to syrup-induced damage compared to traditional GICs, which show better resistance. The *in vitro* studies in this review showed a definite risk of discoloration and increased surface roughness associated with chronic use of many pediatric drug syrups.

Conclusion: Composites and modified GICs demonstrated more vulnerability to syrup-induced detrimental effects compared to traditional GICs. Most of the drug syrups used in children demonstrated the risk of discoloration and increased surface roughness, particularly those with acidic components, pigmenting agents, and high sugar content. Further research is needed to explore specific interactions between the specific liquid drugs and different esthetic dental restorative materials responsible for these effects. Also, research should focus on conducting *in vivo* and long-term studies with standardized assessment protocols.

Clinical significance: Healthcare providers should be aware of the potential effects of liquid medications on dental restorative materials. By integrating this knowledge into clinical practice, healthcare professionals can contribute to the provision of good oral health in pediatric patients.

Keywords: Color stability, Dental restorative materials, Pediatric liquid medications, Surface roughness.

World Journal of Dentistry (2025): 10.5005/jp-journals-10015-2631

Introduction

Pediatric dentists have always been confronted with the problem of replacing a missing tooth or a part of the tooth structure with artificial restorative materials while maintaining esthetics and function. The demand for natural appearance by children and parents has prompted studies to create esthetically pleasing dental materials that resemble natural teeth.[1] These restorative materials can restore cavitated esthetic areas in both anterior and posterior dentition, facilitating the rehabilitation of flawed teeth.[2] Primary teeth are generally restored using glass ionomer cement (GIC), composites, compomers, and their modifications according to the appropriate recommendations based on the particular needs of the children.[3–5] Though these materials are preferred due to their favorable esthetics and compatibility with the oral environment, they differ significantly in their color stability and susceptibility to staining upon their interaction with the oral environment and exposure to various substances.[2]

Staining or lack of color stability is a major issue that arises in all restorative materials over time and is caused by both internal and external factors. Intrinsic color changes can be influenced by a variety of factors, such as the composition of the matrix, the size, and ratio of the filler particles; inadequate polymerization; and surface roughness of the materials. The extrinsic factors include frequent consumption of acid-containing drinks, beverages, food, and acidic medicines with coloring agents/additives.[6–9] Among these, pediatric liquid medications/drug syrups are a common but often overlooked factor that may impact the physical and chemical properties of the restorative materials.

ABSTRACT

Background: The goal of this study was to assess the techniques used in earlier conducted clinical investigations on the chemomechanical eradication of dentinal caries, as well as to assess the variances in pain perception, the time required for complete caries excavation, and how microbiological analysis compared before and following caries removal in primary teeth for both Papacarie and Carisolv. **Materials and Methods:** An electronic search was conducted utilizing the databases PubMed, Google Scholar, EBSCOhost, Scopus, and the Cochrane Library. The following categories were included during the assessment process: full text randomized and controlled clinical trials published between January 2000 and December 2021 in the English language only. Adolescent and child patients with open dentinal carious lesion in primary teeth were included. The methodology of the seven clinical studies chosen was evaluated. **Results:** Findings of the study reported that the microbiota in carious dentine was dramatically reduced with the Papacarie therapy, and the pain perception decreased more in the Papacarie group, whereas Carisolv treatment took longer time for complete caries excavation as compared to Papacarie. **Conclusion:** In conclusion, Papacarie had a beneficial impact by decreasing pain and time taken during caries excavation in primary teeth. The tooth surface treated with Papacarie also demonstrated a reduced bacterial count as compared to Carisolv chemomechanical caries removal approach. Overall, Papacarie and Carisolv are viable minimally invasive and painless techniques for effective caries removal in pediatric patients.

Key Words: Caries excavation, dental caries, dentin, lactobacilli colony count, primary teeth, *Streptococcus mutans*

INTRODUCTION

The term "caries excavation" is defined as mechanical treatment of dental caries-induced tooth damage to best fit the remaining parts of the tooth to receive a filling.[1] Ogushi and Fusayama have demonstrated the two zones within a carious lesion. An inner layer of intact collagen (affected dentin) and a second zone with partially destroyed collagen fibrils that cannot be remineralized (infected dentin).[2] Dental researchers worldwide though are

Comparative evaluation of antibacterial efficacy of sequential herbal irrigation with conventional irrigation in endodontic therapy of primary teeth: A randomized controlled trial

Shrikant Bhujangrao Kendre, Anuja U. Bhatane, Mahesh Vilasrao Dadpe, Yogesh Jagannath Kale, Prasanna Trambakrao Dahake

Department of Pediatric and Preventive Dentistry, MIDSR Dental College and Hospital, Latur, Maharashtra, India

ABSTRACT

Background: Successful endodontic therapy in primary teeth relies on effective microbial control. Although conventional irrigants are effective, they pose risks such as cytotoxicity, unpleasant taste, and tissue irritation. Herbal alternatives offer a safer, biocompatible option, especially suitable for children. **Aims:** To evaluate and compare the antimicrobial efficacy of a sequential herbal irrigation protocol with a conventional irrigation protocol in the endodontic treatment of primary teeth. **Materials and Methods:** It is a split-mouth, double-blind, and randomized controlled trial that included 15 pediatric patients aged 4–8 years with bilateral primary molars indicated for pulpectomy. Group I received conventional irrigation with 3% sodium hypochlorite, 17% ethylenediaminetetraacetic acid, and 2% chlorhexidine. Group II underwent sequential herbal irrigation using ethanolic extracts of 12.5% *Salvadora persica* (Miswak), 20% *Azadirachta indica* (Neem), 2% tea tree oil, and 10% phytic acid. Pre and postirrigation microbial samples were collected and cultured to quantify *Enterococcus faecalis* and *Prevotella intermedia*. Statistical analysis used paired *t*-tests for intragroup comparisons and one-way analysis of variance for intergroup differences, with significance set at $P < 0.05$. **Results:** Both groups showed significant microbial reduction ($P < 0.0001$). Group I had 90.54% and 87.6% reductions in *E. faecalis* and *P. intermedia*, respectively, while Group II achieved 92.2% and 90.54%. Herbal irrigation showed significantly greater *E. faecalis* reduction ($P = 0.025$), but *P. intermedia* reduction was not significant ($P = 0.384$). **Conclusions:** The sequential herbal irrigation protocol showed comparable antimicrobial efficacy to conventional agents, with added benefits of safety, biocompatibility, and reduced cytotoxicity, making it a promising natural alternative in pediatric endodontics.

The Combination of Biomimetic Materials Enhances the Functional Differentiation of Stem Cells Exfoliated from Human Deciduous Teeth

Prasanna T Dahake[1], Shruti Bhamare[2], Yogesh Jagannath Kale[3], Mahesh V Dadpe[4], Shrikant Bhujangrao Kendre[5], Dilip Duryodhan Ghadage[6], Vijay M Kumbar[7]

Received on: 01 December 2024; *Accepted on:* 22 December 2024; *Published on:* 04 September 2025

Abstract

Introduction: Stem cell therapy has been used in a variety of clinical procedures. When introduced into a specific part of the body, these cells differentiate into a target cell type and help replace damaged tissue and improve function. This experimental study was conducted to evaluate the effect of combining various natural biomimetic materials on stem cells from human exfoliated deciduous teeth (SHED).

Materials and methods: After isolation and culturing of SHED to the fifth passage, cells were treated with a regular culture medium (Group I–negative control), osteoinduction medium (Group II–positive control), a combination of mineral trioxide aggregate plus coral (MC, group III), and a combination of Biodentine plus coral (BC, group IV). Viability was assessed using MTT assay on the 7th, 14th, and 21st days. Mineralization was evaluated by Alizarin Red S staining to detect calcium deposits at the same intervals. The anti-inflammatory potential for expression of MMP-9 and MMP-2 was analyzed using gelatin zymography. One-way ANOVA followed by *post hoc* Bonferroni test was applied for statistical comparison ($p < 0.05$).

Results: MC showed better cell viability than BC on the 14th and 21st days. However, BC demonstrated significantly better cytodifferentiation potential ($p < 0.001$) and anti-inflammatory effect ($p < 0.001$) than MC.

Conclusion: With the addition of coral, the properties of both commercially available biomimetic materials were enhanced, resulting in improved osteoinductive properties of mineral trioxide aggregate and Biodentine. The MC combination showed better cell viability and proliferation, while BC showed superior cytodifferentiation and anti-inflammatory properties. Coral, as a natural material, enhanced both formulations significantly.

Keywords: Anti-inflammatory, Biodentine, Coral, Mineral trioxide aggregate, Stem cells from human exfoliated deciduous teeth, Vital pulp therapy.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3192

Introduction

Regenerative endodontic procedures have provided alternative treatment modalities to traditional treatment options for young permanent teeth. Stem cell therapy has been used in a variety of clinical procedures.[1] Pulp tissue harbors dental progenitor cells, opening the gateway to possible therapeutic modalities to preserve the dentin–pulp complex.[2] Vital pulp therapies and pulpotomy are the most commonly used therapeutic modalities to preserve maximum dental tissue in primary and young permanent teeth. In addition, dental materials that maintain or encourage the vitality of the pulp are known as biomimetic materials and are preferred in regenerative endodontics.[3,4]

Test materials used in the present study, such as mineral trioxide aggregate (MTA) and Biodentine, are considered biomimetic materials.[5] MTA has unique stability and excellent sealing properties, along with antimicrobial effects and biocompatibility with native tissues.[6] One study demonstrated proliferation and differentiation of murine homogeneous pulp cells into odontoblast-like cells after contact with MTA, which later demonstrated adhesion, propagation, and relocation of human mesenchymal stem cells (HMSC) or stem cells from human exfoliated deciduous teeth (SHED).[7] It has demonstrated better mineralization potential and minimal inflammation in pulp tissues during clinical use, making it the most preferred material during dental treatments.[3] The main drawbacks of MTA are discoloration, prolonged setting time, and difficulty in removing the material after setting.[8]

Biodentine was first introduced in 2009 due to its several advantages over MTA.[9] Biodentine™ (Septodont, Saint-Maur-des-Fossés, Cedex, France) is frequently used in endodontic therapies and restorative procedures to regenerate tissues of the pulp–

Comparative Evaluation of Thermal Effects, Cleaning Efficacy, and Dentinal Defects of Three Rotary Systems in Primary Teeth: *In Vitro* Study

Shrikant B Kendre[1], Anuja U Bhatane[2], Yogesh J Kale[3], Mahesh V Dadpe[4], Prasanna T Dahake[5]

Received on: 04 September 2025; *Accepted on:* 14 October 2025; *Published on:* xxxx

Abstract

Aim: To compare and assess heat generation during instrumentation, debridement efficacy, and root defects caused by three nickel-titanium (Ni-Ti) rotary systems in primary teeth.

Materials and methods: Sixty-four extracted human primary molars were selected and randomly divided into four groups for cleaning and shaping ($n = 16$). Group I: hand K files, group II: Kedo-S2, group III: Kids-e-files, and group IV: Prime Pedo™ rotary system. During instrumentation, teeth in alginate-filled Eppendorf tubes were placed in a water bath with thermocouples connected at the apical and middle thirds for recording temperature changes. Postinstrumentation, teeth were sectioned for debris and defect analysis under the stereomicroscope. Data were recorded and statistically analyzed.

Results: The mean temperature rise at the middle and apical third for groups I, II, III, and IV was 0.48, 1.85, 2.20, 2.26°C, and 0.73, 3.01, 3.06, 2.85°C, respectively. Mean debris scores for groups I, II, III, and IV were 3, 2, 1.6, and 1.7, respectively. Group II had the most dentinal cracks in the coronal third (mean = 1.42), followed by group IV (mean = 1.28). Group I revealed significant differences ($p < 0.01$) in comparison with II, III, and IV.

Conclusion: All three Ni-Ti rotary systems showed temperature elevations well below the threshold level, preventing harmful thermal effects, and demonstrated superior cleaning and minimal defects, with Prime Pedo™ showing the highest efficacy.

Clinical significance: This study guides the clinician in selecting pediatric rotary systems that are more efficient than manual instrumentation, reducing operative time while maintaining minimal thermal risks and dentinal damage.

Keywords: Dentinal defects, Pediatric rotary files, Primary teeth, Root canal cleaning ability, Thermocouple.

World Journal of Dentistry (2025): 10.5005/jp-journals-10015-2718

Introduction

Preserving primary teeth through effective endodontic treatment is crucial for maintaining space, function, and esthetics in growing children.[1] However, the complex, ribbon-shaped root canals of primary molars pose significant challenges for achieving a three-dimensional seal. Traditional hand instrumentation, though reliable, is time-consuming and prone to iatrogenic errors such as canal transportation and ledging.[2] Pediatric rotary nickel-titanium (Ni-Ti) systems have emerged as a faster, more efficient alternative, revolutionizing pediatric endodontics since their introduction by Barr et al.[3]

Recent advancements have led to the development of exclusive pediatric rotary files, such as the Kedo-S2, Kids-e-files, and Prime Pedo™ systems, each with unique design features. The Kedo-S2 file, a fourth-generation system, incorporates a dual-core Ni-Ti alloy with a variable cross-section—triangular apically for minimal dentin removal and teardrop-shaped coronally for efficient debris clearance.[4] Kids-e-files are advanced heat-treated rainbow rotary files. They have CM wire Ni-Ti memory alloy, which increases flexibility and resistance to cyclic fatigue. The triangular cross-section with a 4% constant taper keeps the center stiffness and high cutting efficiency. The Prime Pedo file system consists of three files (starter, P1, P2). They are gold-treated and have triangular cross-sections—the starter file with 8% taper and P1 and P2 with 6% taper.[5] These systems operate at low speeds (250–300 rpm), reducing procedural risks while improving efficacy.[5]

Conflict of interest: None

However, concerns remain regarding heat generation during instrumentation, which can potentially damage surrounding periodontal tissues. Studies indicate that temperatures exceeding 47°C risk irreversible bone resorption, emphasizing the need for thermal safety assessments.[6] Additionally, rotary instrumentation may induce dentinal defects such as microcracks, compromising root structural integrity. The varying designs, tapers, and kinematics of different Ni-Ti systems further complicate their clinical predictability.[7]

Considering these factors, this study aims to compare and assess heat generation during instrumentation, debridement efficacy, and root defects caused by three Ni-Ti rotary systems

Adverse Effects of Paediatric Liquid Medications on Primary Teeth: A Systematic Review

NIKETA N DESHMUKH[1], YOGESH J KALE[2], MAHESH V DADPE[3], PRASANNA T DAHAKE[4], SHRIKANT B KENDRE[5]

(cc) BY-NC-ND

ABSTRACT

Introduction: Paediatric liquid medications are widely administered due to their ease of use and high compliance. Emerging evidence, however, suggests these formulations may have unintended oral health consequences. Specifically, the primary dentition may experience erosion, discolouration, and altered surface properties. Studying the adverse effects of different paediatric liquid medications on primary teeth reflects a growing understanding of the complex interactions between medications and dental health and ongoing efforts to mitigate potential risks to children's oral health.

Aim: The present systematic review was conducted to summarise and assess the effects of various paediatric drugs on primary teeth by reviewing the available literature.

Materials and Methods: The present systematic review was conducted in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Protocols (PRISMA-P) guidelines and was registered on PROSPERO (CRD42023413689). The PROSPERO record is available at https://www.crd.york.ac.uk/prospero/display_record.php?ID=CRD42023413689. An extensive search of electronic databases was conducted covering January 2000 to December 2023 to identify studies reporting adverse effects of paediatric drugs on primary teeth. Quality assessment of the included studies was performed using the Quality Assessment Tool For In Vitro Studies (QUIN) tool.

Results: After meeting the eligibility criteria 24 in-vitro studies were included. Each study analysed the effects of medications on primary teeth. Enamel erosion, increased surface roughness, and discolouration were observed with most paediatric liquid medications.

Conclusion: This systematic review, included 24 studies, demonstrated associations between paediatric liquid medications and deleterious effects on the primary dentition. These adverse effects are likely driven by the acidic components, colouring additives, and prolonged contact time of the formulations. Despite methodological variations among studies, the consistent findings across different medication classes reinforce these conclusions. By integrating this knowledge into clinical practice, healthcare professionals can contribute to the promotion of optimal oral health in paediatric patients.

Keywords: Dental caries, Dental erosion, Discolouration, Enamel loss

INTRODUCTION

Doctors recommend medications to address various health concerns [1]. The various routes of drug administration are oral, nasal, sublingual, cutaneous, parenteral, and rectal [2]. Among these, the oldest, most common, and easiest administration route is the oral route [3]. Oral drugs, such as capsules, are coated to mask unpleasant tastes and are inappropriate for use in children due to their inability to swallow them at a young age [4]. Therefore, medication in liquid form is recommended for them. Both parents and children find them easily obtainable and highly acceptable [5]. In paediatric medicine, syrups have been used for an extensive period. Their use is typically for a shorter period, but it may be a regular occurrence for some children [5]. Long-term use of sugary liquid medications increases the risk of cavities. While parents know sugar causes decay, they often overlook medications as a sugar source. Children taking medications for chronic or recurring illnesses, and even supplements, are at risk of dental caries [6,7].

Analysis of drug properties revealed that pH, viscosity, acidity, and sugar content contribute to adverse dental effects such as erosion, staining, and hypoplasia [5,8]. Studies show that children using long-term, sugar-containing medications have a higher rate of caries than those not taking such medications [8-11].

Dental erosion, defined as irreversible tooth loss from acid (not bacteria), has external and internal causes. Internal causes include stomach acid contact with the tooth, as in GERD. Extrinsic sources of dental erosion include excessive consumption of acid-containing drinks, beverages, foods, and acidic medicines [6]. A drug's erosive potential depends on its titratable acidity, pH, and pKa. Acidic formulations are often needed for effective dispersal, reactions, stability, compatibility, and taste [7,12]. Frequent ingestion (more than twice daily), night time or between-meal consumption, high viscosity, and reduced saliva flow can increase medication-induced dental erosion [1,13,14].

Certain in vitro studies have shown that drugs may disrupt the structure and hardness of enamel [12,14]. However, the literature lacks research examining how medications affect primary tooth enamel, and the results of these investigations are restricted to a limited number of drugs [15]. According to some authors [5,8], the difference in erosion between primary and permanent teeth is due to differences in their morphology. Nevertheless, there is still debate regarding the vulnerability of primary teeth to both caries and erosion compared to permanent teeth [14].

To address the lack of thorough research on paediatric medication effects on primary teeth, a systematic literature review was conducted to summarise and evaluate these effects.

MATERIALS AND METHODS

This review was conducted in compliance with the Preferred Reporting Items for Systematic Review and Meta-Analysis Protocols (PRISMA-P) statement. An extensive search of electronic databases was conducted covering January 2000 to December 2023.

Data Items

The aim of this review was to assess the effect of various paediatric liquid medications on primary teeth. The research question in PICOS format was: "What are the adverse effects of various paediatric

Comparative Evaluation of Shear Bond Strength and Microleakage of Three Different Restorative Materials in Primary Molar Teeth: An *In Vitro* Study

Mahesh V Dadpe[1], Umesh R Kendre[2], Yogesh J Kale[3], Prasanna T Dahake[4], Shrikant B Kendre[5]

Received on: 21 February 2025; *Accepted on:* 29 April 2025; *Published on:* 17 November 2025

Abstract

Background: In minimally invasive dentistry, adhesive restorative materials are widely used both as bulk restoratives and for the repair of occlusal, proximal, cervical, and multisurface cavities. These consist of conventional, modified glass ionomers, compomers, composites, and new alkasite materials. Few investigations have focused on comparing the *in vitro* behavior of recently developed restorative materials.

Aim: To compare and assess the microleakage and shear bond strength (SBS) of 3M ESPE Composite (Filtek Z350 XT), Kids-e-Restore, and Cention N in primary molar teeth.

Materials and methods: This experimental investigation was divided into three groups: Cention N was in group I, Kids-e-Restore was in group II, and 3M ESPE composite (Filtek Z350 XT) was in group III. Shear bond strength testing was done by a universal testing machine. The maximum load was recorded during the testing. Samples were analyzed through a stereomicroscope to evaluate bond failure mode. Dye penetration was used to assess microleakage, and a stereomicroscope was used for examination.

Results: 3M Filtek Z350XT had the highest SBS, and Cention N had the lowest. Kids-e-Restore showed the least amount of microleakage, then by Cention N and 3M Filtek Z350 XT.

Conclusion: Composite resin (3M Filtek Z350 XT) has better SBS than Cention N and flowable GIC (glass ionomer cement) (Kids-e-Restore) in primary molar teeth. Flowable GIC (Kids-e-Restore) showed less microleakage and is a good adjunct for class II restorations.

Keywords: Cention N, Filtek Z350 XT, Kids-e-Restore, Microleakage, Shear bond strength.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3313

Introduction

In the era of minimally invasive dentistry, adhesive restorative materials are extensively used both as bulk restorative options and for repairing occlusal, proximal, cervical, and multisurface cavities. These consist of composites, compomers, modified glass ionomers, and conventional glass ionomers.[1] An ideal restorative material should have a number of qualities, including excellent wear resistance, minimal water absorption, no microleakage, strong shear bond strength (SBS), biocompatibility, and good compressive, flexural, and tensile strength. Because of their superior mechanical qualities, resin-modified glass ionomer cements (RMGICs) and composites are regarded as better than other materials.[2]

Furthermore, composites and RMGICs also exhibit anticariogenic and fluoride-releasing properties. Within the category of adhesive restorative materials, Cention N is a novel alkasite substance. It has an alkaline filler that helps control pH and releases acid-neutralizing ions in acidic environments, preventing dental cavities. Additionally, it releases calcium and fluoride, which can help remineralize early enamel defects.[3] The monomer matrix of this novel bioactive material consists of different urethane dimethacrylates (UDMA), including UDMA, dicarbonyl dimethacrylate (DCP), polyethylene glycol 400 dimethacrylate (PEG-400 DMA), and an aromatic aliphatic component.

According to manufacturers, the material Cention N is sophisticated and has good mechanical properties that can compete with established, tried-and-true esthetic adhesive materials such as composites and RMGICs.

Source of support: Nil

Conflict of interest: None

Several studies have evaluated the fluoride release, flexural strength, and compressive strength of Cention N. Although it is not classified as a composite, *in vitro* findings indicate that Cention N exhibits superior mechanical properties compared to conventional glass ionomer cement (GIC). However, composites are preferred more often due to their wider shade availability, which Cention N lacks. A more appropriate comparison is with RMGIC, as both materials allow bulk filling and curing.[4,5]

Kids-e-Restore is a resin-reinforced glass ionomer restorative that is self-adhesive, light-cured, flowable, and ready to use. By releasing fluoride, it enhances antibacterial and anti-inflammatory action, has self-adhesive technology, and does away with etching and bonding processes that require chemical adhesion. There

SYSTEMATIC REVIEW

Factors Affecting Success and Failure of Pulpectomy in Primary Teeth: A Systematic Review

Shrikant Bhujangrao Kendre[1], Anuja U Bhatane[2], Yogesh Jagannath Kale[3], Mahesh V Dadpe[4], Prasanna T Dahake[5]

Received on: 25 January 2025; *Accepted on:* 02 May 2025; *Published on:* 16 December 2025

Abstract

Aims and background: A pulpectomy in primary teeth is considered successful when there are no clinical symptoms or radiographic evidence of pathology. Outcomes vary due to multiple influencing factors, and comprehensive long-term evidence remains limited. This systematic review evaluates pulpectomy success over long-term follow-ups and identifies risk factors for failure.

Methods: An electronic database search was conducted in PubMed, EBSCOhost, Scopus, and Cochrane from January, 1990 to December 30, 2024. Different keywords were employed in various combinations during the search process to find all possible articles focused on our subject. The Cochrane risk of bias tool (ROB 2.0) was employed for evaluating randomized controlled trials, whereas observational studies were assessed using the ROBINS-I tool.

Results: A total of 360 articles were reviewed, and only 12 satisfied the inclusion requirements. The success rate of pulpectomy ranged between 38.5% and 96.2% over 5 years. The minimum amount of preoperative root resorption and adequate length of root canal filling material are the common factors associated with the success of pulpectomy. Zinc oxide eugenol (ZOE) and Endoflas success rate were 90% and 71% or less for iodoform after 18 months of evaluation.

Conclusion: Factors associated with the success of pulpectomy were an absence of preoperative periapical lesions, minimal preoperative root resorption, adequate root canal filling, and the type of postendodontic restoration. The factors associated with pulpectomy failure were the presence of a periapical lesion, preoperative swelling, fistula, pulpectomy performed in trauma cases, and inadequate quality of the root filling. Age, gender, tooth position, treatment modality, and number of appointments did not significantly affect pulpectomy.

Clinical significance: This systematic review holds significant clinical value as it enhances treatment predictability, minimizes failures, and supports the preservation of primary teeth, ultimately benefiting pediatric oral health.

Keywords: Clinical and radiographic evaluation, Factors, Longevity, Primary teeth, Pulpectomy, Success and failure, Survival rate.

International Journal of Clinical Pediatric Dentistry (2025): 10.5005/jp-journals-10005-3343

Introduction

Involvement of pulp due to caries or trauma in primary teeth leads to irreversible damage, causing degeneration or necrosis. To preserve such a tooth in the oral cavity to maintain function as well as arch integrity, an endodontic procedure like pulpectomy is indicated.[1] Following all the standard procedural protocols, the primary teeth are preserved in the oral cavity. To consider the procedure successful, the absence of signs and symptoms clinically and radiographically is considered as prime criteria.[2] Several studies and ongoing research have shown that pulpectomy has a better prognosis as a treatment modality. However, conclusive findings are still elusive. Success and failure can be determined by a wide range of possible factors that are inconsistent. The success rate can differ according to the preoperative findings, such as lesion etiology, type of lesion, type of filling materials, and the clinician's expertise. The failure was more likely to occur in patients with greater levels of gingivitis and visible plaque. Additionally, risk variables for failure were identified as the presence or absence of full coronal restoration.

The review on pulp treatment techniques for extensively decayed primary teeth published in Cochrane in 2018 had certain limitations that included both vital and nonvital pulp therapies without a focused analysis on pulpectomy procedures. Additionally, the included evidence was current only up to August, 2017, potentially omitting recent advancements in the area.[3] Another systematic review published in 2019 exclusively assessed the success of zinc oxide eugenol (ZOE) and calcium hydroxide-iodoform paste about the quality of obturation for pulpectomy procedures in primary teeth and did not evaluate the factors.[4]

A systematic review published in 2020 on randomized controlled trials assessed success rates for nonvital therapy in primary teeth and compared lesion sterilization and tissue repair (LSTR) with pulpectomy for a 6–12 months follow-up.[5] This paper, being a short-term evaluation, represents a significant limitation, contrary to more predictable long-term treatment success. Hence, an evident gap was found to exist in the last 4 years regarding substantial comparative papers for such findings.

Clinical Insights on Mesiodens: A Case Series

Dr. Mansi Bhakkad[1], Dr. Mahesh Dadpe[2], Dr. Yogesh Kale[3], Dr. Prasanna Dahake[4], Dr. Shrikant Kendre[5]

[1]Postgraduate Student, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

[2]HOD & Professor, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

[3,4] Professor & PG Guide, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

[5]Reader, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

Abstract:

Supernumerary teeth, also known as hyperdontia, refer to the presence of additional teeth beyond the normal dental count in the arch. The prevalence of supernumerary teeth in the anterior region is 2.2%, with mesiodens accounting for 78.4% of these cases. Mesiodens, the most common type of supernumerary teeth, can cause several complications, including spacing, crowding, eruption issues, and esthetic concerns. These anomalies are particularly significant during the primary and early mixed dentition stages, as they can lead to various dental problems such as speech difficulties, resorption of adjacent tooth roots, delayed eruption of permanent incisors, and the potential development of dentigerous cysts. Early identification and management of mesiodens are crucial to avoid further complications in permanent dentition. The current paper focuses on seven cases of mesiodens identified during the primary, mixed and permanent dentition phase, along with their effective management strategies.

Keywords: Mesiodens, Supernumerary tooth, Pediatric dentistry, Case reports

Corresponding Author: Dr. Mansi Bhakkad, Postgraduate Student, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur, Email – mansi.bhakkad1234@gmail.com

INTRODUCTION:

Supernumerary teeth are additional teeth that develop in the mouth and can affect the eruption and alignment of normal teeth.1 Mesiodens are the most common type of supernumerary teeth, typically found in the maxillary anterior region between the central incisors. The prevalence of supernumerary teeth is 0.15–1% in permanent dentition and 0.3–0.6% in the primary dentition with predilection of 2:1 for male sex.2 These teeth are often identified during routine dental examinations or as a result of complications such as delayed eruption, diastema, displacement of adjacent teeth, or root resorption.3 While mesiodens may remain asymptomatic, their presence near critical anatomical structures such as the nasal floor can pose diagnostic and surgical challenges. It can affect both maxilla and mandible; however, its occurrence in the mandible is rare.4 The most common type of supernumerary tooth as indicated by Alberti et al is mesiodens. Mesiodens may occur as single, multiple, unilateral or bilateral.5 The exact etiology of mesiodens tooth is not clearly known, though various theories have been suggested, including dichotomy of the tooth bud, hyperactivity of the dental lamina and combination of genetic-environmental factors. Single supernumerary teeth may be seen in association with conditions like cleft lip and/or palate, Downs syndromes, Cleidocranial dysplasia, etc.6 In some syndromes, mesiodens may present as a part of the

[5]Reader, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur

Abstract:

In order to save carious primary teeth until their natural exfoliation and retain the structure and function of the arch, pulpectomy is still a fundamental treatment in Pediatric dentistry. The mechanical and biological characteristics of the obturating substance utilized have a significant impact on the pulpectomy's long-term success. The conventional option of zinc oxide-eugenol (ZOE) has drawbacks such cytotoxicity and delayed resorption. The powerful antibacterial, anti-inflammatory, and healing-promoting qualities of zinc oxide-ozonated oil (ZnO-OO) have drawn attention recently. This review compares the performance of ZnO-OO with both established and novel materials, combining the recent data from four important in vivo investigations. ZnO-OO is an appealing option for juvenile endodontics because of its high clinical and radiographic success, remarkable biocompatibility, and exceptional handling qualities, as shown by consistent results.

Keywords: Narrative Review, Obturating Material, Pediatric Dentistry, Pulpectomy, Zinc Oxide Ozonated Oil

Corresponding Author: Dr. Kamesh Bhamare, Postgraduate Student, Department of Pediatric and Preventive Dentistry, MIDSR Dental College, Latur, Email – kameshbhamare@gmail.com

INTRODUCTION:

Mastication, phonation, aesthetics, and directing the emergence of permanent teeth are all critical functions of primary teeth. It is crucial to keep these teeth intact until their natural exfoliation, particularly if pulp diseases are present. Pulpectomy is recommended when primary teeth exhibit permanent pulpitis or necrosis. This procedure entails total debridement and obturation of the root canal system. The optimal obturating material should be radiopaque, biocompatible, resorbable, antibacterial, and easy to apply without interfering with succeeding eruption.

Because of its antibacterial properties and track record of dependability, zinc oxide-eugenol (ZOE) has been utilized extensively. Nevertheless, it may not resorb as quickly as primary roots and may remain in the periapical area, which may interfere with the permanent successors' eruptive route and result in periapical inflammation1. Furthermore, at high doses, the eugenol component is cytotoxic2,3,4. Alternative materials like calcium hydroxide, iodoform-based pastes (like Vitapex), herbal formulations, and biologically inspired combinations like 3Mix have been investigated as a result. Because of its biological qualities, which include antibacterial activity, debriding impact, angiogenesis promotion,

KEYWORDS

Resin infiltration, white spot lesions, fluorosis, hypoplasia, CPP-ACP, remineralization

ABSTRACT:

Background: White spot lesions (WSLs) from fluorosis, enamel hypoplasia, or early caries are common esthetic concerns in children. Resin infiltration is a minimally invasive option, but color stability may vary by lesion type. The adjunctive use of casein phosphopeptide-amorphous calcium phosphate (CPP-ACP) could enhance outcomes, though evidence is limited.

Aim: To assess the 12-month color stability of non-cavitated WSLs of different etiologies treated with resin infiltration alone or with CPP-ACP.

Methods: A prospective randomized clinical trial was conducted on 90 anterior teeth from 25 children (7–13 years) with non-cavitated WSLs. Teeth were grouped by etiology (fluorosis, hypoplasia, caries) and subdivided into two subgroups (n=15 each): resin infiltration alone or resin infiltration with CPP-ACP. Spectrophotometric color change (ΔE) was recorded at baseline, immediately post-treatment, and at 1, 2, 6, and 12 months. Data were analyzed using ANOVA and Tukey's post hoc test.

Results: Only the hypoplastic group treated with resin infiltration alone showed significant color change over time ($p=0.007$). At six months, intergroup differences were significant ($p=0.049$), though post hoc analysis revealed no pairwise significance. Carious lesions treated with combination therapy demonstrated the most stable ΔE over 12 months. Fluorosed and hypoplastic lesions showed variable and less predictable outcomes.

Conclusion: Resin infiltration provides varying color stability across lesion types. Adjunctive CPP-ACP enhances outcomes in carious WSLs but has limited benefit for fluorosed and hypoplastic lesions. Lesion structure and resin penetration dynamics may influence long-term esthetic success.

Abstract:

Introduction: *Early Childhood Caries (ECC) is a significant dental public health problem that affects infants and preschool children all over the world, especially in economically poor population in developing and industrialised countries where under nutrition is common.*

Aim: *To assess the prevalence of ECC among 3 to 5 year old preschool children in Parbhani city, Maharashtra, India*

Method: *A cross sectional study was carried out on total 637 preschool children of 3-5 year age from different areas of Parbhani city were selected randomly. ECC was recorded using 'dmft' index. And data was analysed using SPSS version in statistical software program and Chi square test was used to evaluate the results of prevalence of ECC.*

Results: *Prevalence of ECC in 3-5 year old children was found to be 40.97% (n=261). ECC was more prevalent in males 68.19% (n=178) as compared to females 31.81% (n=83). It was found more in the age group of 4 year 47.12% (n=123). And more in the maxillary posterior 40.37% (n=214) region followed by mandibular posterior region 31.69% (n=168). In maxillary anterior region it was 25.84% (n=137) with least prevalence of ECC in mandibular anterior region 2.1% (n=11).*

Conclusion: *Since the prevalence of dental caries is high among the population, effective preventive measures should be taken as early as possible.*

Keywords: *Caries, Childhood, preschool*

INTRODUCTION

Dental caries is one of the most common global oral health problems worldwide, mainly in developing countries[1]. Early Childhood Caries (ECC) is the name used to describe the occurrence of caries in primary dentition prior to the eruption of permanent teeth. This terminology was proposed as an 'umbrella term' for caries in primary teeth in 1994. Caries affecting preschool children known as early childhood caries (ECC) which is defined as according to AAPD "the presence of 1 or more decayed (noncavitated or cavitated lesions), missing (due to caries), or filled tooth surfaces in any primary tooth in a child 71 months of age or younger". ECC causes significant

CD34 Angiogenesis Marker in Oral Squamous Cell Carcinoma: An Immunohistochemical Study

Vijayalaxmi[1], Sunil S Mishra[1], N. C. Sangamesh[2]

[1]Department of Oral Medicine and Radiology, Dr. D. Y. Patil Dental College and Hospital, Dr. D. Y. Patil Vidyapeeth, Pimpri, Pune, Maharashtra, India, [2]Department of Oral Medicine and Radiology, Kalinga Institute of Dental Sciences, KIIT DU, Bhubaneswar, Odisha, India

Abstract

Background: Angiogenesis is recognized as a predominant factor for tumor growth and metastasis. Use of biomarkers to target tumor holds a promising treatment strategy and to assess prognosis. **Objectives:** To assess angiogenic activity by analyzing CD34 microvascular density (MVD) count in different histologic grades of oral squamous cell carcinoma (OSCC). **Materials and Methods:** Sixty archival samples are categorized in four groups. Immunohistochemical method with anti-CD34 was used for analyzing MVD. **Results:** The mean count of MVD is higher in OSCC than in normal mucosa and also significant among different histologic grades. Highly significant correlation is observed among different groups of OSCC samples. **Conclusion:** CD34 shows a promising result in OSCC.

Keywords: *Angiogenesis, CD34, microvessel density, oral squamous cell carcinoma, tumor*

Introduction

Angiogenesis is an essential and predominant mechanism involved in tumor growth and metastasis. In hypoxic condition, apoptosis of cells occur and thus formation of new vessels allow diffusion of oxygen and nutrients and helps for tumor growth through capillary sprouting.[1] Angiogenic switch is a term applied when the activity of proangiogenic factors exceeds the activity of antiangiogenic factors, thereby resulting in neoangiogenesis.[2] The switch is "on" when net balance is tipped in favor of angiogenesis and "off" when proangiogenic molecules balances the effect of antiangiogenic molecules.[3] Long noncoding ribonucleic acids play the role of proangiogenic and antiangiogenic molecules.[2] CD34 a sialomucin transmembrane phosphoglycoprotein and biomarker for hematopoietic stem cells and endothelial progenitor cells.[3,4] CD34 is also widely expressed on mature vascular endothelial cells of blood vessels.[5] CD34 is involved in a variety of cellular processes, including angiogenesis, immune regulation, and organ fibrosis for developing microvasculature.[3] CD34 is expressed on hematopoietic and nonhematopoietic cells.[4] CD34 has the capacity for rejuvenation, thereby a reservoir for stem cells and neovascularization. The inherent properties of CD34 are vasculogenesis, angiogenesis, and antiinflammation.[1,3] CD34 is a panendothelial marker, in neoangiogenesis of oral squamous cell carcinoma (OSCC), the precursors of undifferentiated endothelial cells express CD34.[6]

Materials and Methods

Ethical clearance is obtained from the Institutional Ethics Committee with registration no. DYPV/EC/835/22.

Study design

The study is carried in Preclinical Research Center at Navi Mumbai. The sample size calculation is derived by using the formula $n = 2\ (S^2)/d^2\ (Z_{\alpha/2} + Z_{1-\beta})^2$, where $Z1 - \alpha/2$ = Z-value for α level = 2.58 at 1% alpha error. $Z\ 1 - \beta$ = Z-value for β level = 1.037 at 85% power.

A total of 60 histopathological samples are studied, 17 are well differentiated, 17 moderately differentiated, 16 poorly differentiated, and 10 control.

Method of data collection

Three micrometers thick histological sections are taken from the tissue specimens and fixed in 10% formalin and embedded in paraffin. The sections are mounted on clean glass slides and analyzed immunohistochemically. The slides are

CD105 as a Marker of Angiogenesis in Oral Squamous Cell Carcinoma – An Immunohistochemical Study

Vijayalaxmi[1], Sunil S. Mishra[1], N. C. Sangamesh[2]

[1]Department of Oral Medicine and Radiology, Dr. D. Y. Patil Dental College and Hospital, Dr. D. Y. Patil Vidyapeeth, Pimpri, Pune, Maharashtra, India, [2]Department of Oral Medicine and Radiology, Kalinga Institute of Dental Sciences, KIIT DU, Bhubaneswar, Odisha, India

Abstract

Background: Oral squamous cell carcinoma (OSCC) is the most prevalent carcinoma of the head-and-neck region. Despite advanced tissue diagnosis, the survival period remains at 5 years. New molecular and cell markers are under investigation to improve survival rate. **Objective:** The objective of this study was to assess angiogenic activity by analyzing CD105 microvascular density (MVD) count in different histologic grades of OSCC. **Subjects and Methods:** Sixty samples are categorized into four groups. Immunohistochemical method with anti-CD105 was used for analyzing MVD. **Results:** The mean count of MVD is higher in OSCC than in normal mucosa and also significant among different histologic grades. A highly significant correlation is observed among different groups of OSCC samples. **Conclusion:** CD105 is a predictive marker for neoangiogenesis in OSCC.

Keywords: *Angiogenesis, CD105, microvessel density*

Introduction

Ninety percent of head-and-neck cancers are classified as oral squamous cell carcinoma (OSCC) which is the 6th most common cancer in the world.[1,2] The WHO identifies the Broder's histologic classification of OSCC based on the resemblance of tumor cells to parent tissue and the amount of keratin formed as well differentiated, moderately differentiated, and poorly differentiated.[3]

Angiogenesis is a fundamental biological process and is a predominant factor in progression of oral cancer and associated metastases. The presence of isolated tumor cells at tumor front is suggestive of local invasion and is associated with worst prognosis.[4] Various research have indicated the importance of neoangiogenesis and microvascular density (MVD) for progression of tumor.

Tumor microenvironment (TME) is complex and is continuously evolving and the hallmark includes diverse immune cells, stromal cells, endothelial cells, original tissue cells, and extracellular matrix. However, TME composition varies between tumor types.[5] CD105 (endoglin) is a transmembrane phosphorylated glycoprotein, and a fundamental constituent of Transforming Growth Factor (TGF)-beta receptor signaling pathway, and a prognostic factor in OSCC.[6] Endoglin is involved in promoting cold tumors to hot by angiogenesis, inflammation, and cancer-associated fibroblast accumulation.[7]

Once the volume of tumor reaches 1–2 mm³, the tumor gets deprived of oxygen and metabolic waste build up resulting in hypoxic and acidic TME. The reprogramming of cell energy metabolism toward mechanism that consumes less oxygen and avoids immune destruction helps tumor cells survive and proliferate.[5,7] For tumor to survive and overcome hypoxia and acidic TME, new vascular channels must develop in tumor by release of proangiogenic factors by immune cells and inflammation that modify extracellular matrix.[5,7] Oxygen-deprived TME activates hypoxia-inducible factors (HIFs) and transcription factors which manifest critical in coordinating tumor cellular responses and thereby HIFs induce vessel sprouting by directing ECs to secrete proangiogenic factors such as platelet-derived growth factor, epidermal growth factor, and vascular endothelial growth factor.[5] Formation of new blood vessels by sprouting is a common mechanism used by tumors.[5] The net effect is a result of increased expression of proangiogenic factors, decreased

Abstract

The term a peripheral ossifying fibroma, also known as ossifying fibrous epulis, is "a gingival nodule which is composed of a cellular fibroblastic connective tissue stroma which is associated with the formation of randomly dispersed foci of mineralised products, which consists of bone, cementum-like tissue, or a dystrophic calcification. The lesion is considered part of an ossifying fibroma, but that is usually considered to be a jaw tumor.

Abstract

Purpose: The National Service Scheme (NSS) is one of the educational reforms started by the Government of India aimed at the overall development of students, especially in terms of social responsibility and personality. The present trial was undertaken to evaluate the impact of the NSS on the professional and personal competency skills of dental students in India.

Methods: A randomized controlled trial was undertaken among 84 final-year dental students in a dental college from Maharashtra, India. The participants were randomly allocated into the study group (exposed to the NSS) and the control group (not exposed to the NSS). A self-administered questionnaire evaluated the perceived change experienced in their professional skills (clinical confidence and communicational skills) and personal development (confidence, leadership skills, moral values, and social responsibility) from baseline and the exposure to the NSS program via global self-assessment test, then-test, and transition judgment. The mean of the groups was compared, and a t-test was employed.

Principal
M.I.D.S.R. Dental College
LATUR

Results: The study group experienced a significant level of improvement in their perceived levels of communication skills, confidence, leadership skills, and social responsibility in comparison to the control group with $p \leq 0.05$ for the global self-assessment scale. The transition judgment was also statistically significant for change in overall perceived confidence and leadership skills ($p \leq 0.05$).

Conclusion: The NSS provides promising results in improving the overall perceived professional and personal competency of dental students in India. Thus, such kinds of programs can play a vital role in dental education in developing countries.

***Abstract*— By facilitating real-time data gathering and evaluation, the Internet of Things' (IoT) incorporation in remote dental health monitoring is transforming preventive oral care. This research investigates a clever method for identifying early indicators of dental problems like cavities, gum disease, and plaque formation using IoT-enabled sensors and machine learning algorithms. A number of ML methods were assessed for computational efficiency, recall, precision, and predictive accuracy, comprising CNN, Random Forest, SVM, and XGBoost. With an AUC-ROC score of 0.98 and a test accuracy of 94.9%, the CNN model performed the best. IoT sensors, such as pressure and imaging sensors, were able to identify oral health issues with an accuracy of over 96%. To maximise IoT efficiency, energy use and false positive rates were also examined. Through ongoing, remote, and AI-assisted diagnostics, outcomes demonstrate how IoT-driven smart monitoring can lower dental dangers and encourage proactive care.**

***Keywords*—IoT, Remote dental health, preventive care**

I. INTRODUCTION

The infectious illness known as dental caries is impacted by a number of factors. Even though it may be avoided, it is a serious global public health issue. Dental caries is the most prevalent illness, impacting 560 million primary teeth and 1.3 billion permanent teeth, based to the Global Burden of illness Survey conducted in 2015 [7]. One of the most common noncommunicable illnesses, dental caries affects people of all ages, but especially children, and negatively impacts their general health through inflammatory or nutritional pathways, well-being, social interactions, and economic status [8]. Since it cannot be adequately addressed by a single preventive action, a comprehensive preventative approach [9] is needed. The IoT-based intelligent services are therefore essential in this period of advanced digital technology since they may provide sufficient answers in a management system or service across numerous businesses, involving healthcare.

The term IoT encompasses a broad range of contemporary techniques that have the potential to connect the digital (information) and physical (items) worlds. An early modern network of physically attached objects is known as the IoT.

Users can get information from this network that is linked via the Internet [10] [11]. The WHO defines the IoT as "a system of interconnected computing devices, machines and digital machinery, objects, animals, or people over a network with distinctive identifiers and equipped of transmitting data without the demand for human-to-human or human-to-computer communication." The IoTis seen as an ecosystem that consists of smart devices with sensors, networking, and processing techniques that integrate and cooperate to create an environment where end users may access smart services. The largest new technological development that has sparked an unparalleled information revolution is the IoT. IoT smart devices, of which smartphones are a subset, are crucial to the expansion of IoT devices.There are numerous advantages to using smart devices, including improved communication, increased autonomy, and the ability to share knowledge, all of which can boost productivity [12].

Any smart device that can examine wellbeing information and convey to the Web to complete different telehealth administrations, for example, robotically helped a medical procedure, telemonitoring, matured care oversight, and teleconsultations, is alluded to as the IoT [13] [14]. In spite of the fact that IoT gadgets — most of which are cell phones — share similar portable organization foundation, they utilize unmistakable specialized strategies, complete particular errands, and face unmistakable security threats.Numerous clinical applications, including far off wellbeing checking that could permit carers to notice patients' medical issues continuously and medicine or therapies consistence at home by medical services

Abstract:

Background: The maxillary labial frenum exhibits considerable variability in its structure. De various syndromic and non-syndromic conditions, it is frequently overlooked in standard intraor comprehensive research on the types and morphological variations of the maxillary labial population. This study seeks to assess the prevalence and diversity of the maxillary labial fre Department of Periodontology.

Materials and Methods: A cross-sectional study was conducted in a clinical setting involvi years. The labial frenum was assessed through direct visual examination, and intraoral p participant. Demographic information was recorded, and frenal attachments were classified a established by Mirko et al. and Sewerin et al.

Results: The gingival type of frenum was the most frequently observed, found in 185 partic type was the least common, seen in 6 participants (2%). Morphological variations ion variation being the presence of a nodule in 13 cases, followed by an appendix in frenum was the most common type of frenal attachment, followed by the mucosal, papillary across all age groups and genders. More than 75% of participants exhibited no morphological va

Abstract

Introduction: *Scientific research is fundamental to advancing healthcare quality and dental practice. This study aimed to assess the knowledge, attitude, practices, and barriers related to scientific research among undergraduate dental students in the Marathwada region.*

Methods: *A cross-sectional, web-based questionnaire survey was conducted among third-year, final-year BDS students, and interns. The survey comprised sections on demographics, knowledge, general and personal attitudes, practices, and barriers toward research. Data were analysed using descriptive statistics.*

Results: *A total of 552 students participated, with 77.9% females. Correct knowledge of research objectives was low (16%), though awareness of null hypothesis (60.1%) and double-blind trials (58%) was better. Positive attitudes were predominant, with 65.2% supporting inclusion of research methodology in the curriculum and 70% interested in research workshops. However, research practice was limited; only 20.4% attended research courses, and 12.1% had publications. The primary barrier identified was lack of time (around 50%).*

Conclusion: *Undergraduate dental students in the Marathwada region possess a foundational understanding and positive attitude toward scientific research but engage less in active research practices. Incorporating research training into the dental curriculum and providing structured opportunities could enhance student participation and foster research competency.*

Keywords *– Knowledge, Attitude, Research, Cross sectional survey, Students, Dental, Dentistry.*

Hepatitis B virus (HBV) is a serious global health concern associated with significant morbidity and mortality. Dental professionals face an increased occupational risk due to frequent exposure to blood and body fluids. Inadequate knowledge or preventive practices often contribute to HBV transmission in dental settings.

This study aimed to assess the knowledge, awareness, and preventive practices toward HBV among dental students, identifying misconceptions that may hinder quality care and providing a baseline for future educational interventions.

A cross-sectional survey was conducted from September 12 to 18 among dental students (undergraduates and post graduates) at MIDSR Dental College, Latur. Data were collected through a structured 13-item questionnaire distributed via Google Forms. Responses from 210 participants were analysed descriptively.

The survey received 210 valid responses. Analysis revealed that most participants had satisfactory knowledge and awareness regarding HBV infection and vaccination. A majority were either fully or partially vaccinated against HBV.

In conclusion, although awareness levels among dental students were satisfactory, consistent reinforcement through education and vaccination drives is essential. Students should be encouraged to initiate and complete the full HBV vaccination course during their clinical training to ensure optimal occupational safety.

KEYWORD: Hepatitis, dental students, awareness, vaccination, infection, blood borne pathogens

Introduction

Viral Hepatitis is an infectious disease that causes inflammation of the liver and is generally classified into five main types: A, B, C, D, and E. Hepatitis B Virus (HBV) is a common health problem worldwide and is known to be the most serious among the five types, given its high prevalence and the fact that it can progress into a chronic infection with life-threatening complications. Moreover, HBV is considered a "silent disease" as infected persons are often asymptomatic carriers; hence, the further spread of the disease goes unnoticed.

HBV is a leading cause of acute liver failure, cirrhosis, hepatocellular carcinoma (primary liver cancer), and possibly even pancreatic cancer all of which are severe, possibly fatal conditions. HBV belongs to a family of viruses known as the Hepadnaviridae family. It is a relatively small DNA virus that replicates by reverse transcription and thus integrates into the host genome. The pathophysiology of HBV infections is that the virus alters the antigen structure on the host cell, to Viral hepatitis is an infectious disease causing inflammation of the liver and is classified into five main types: A, B, C, D, and E.[1] Hepatitis B virus (HBV) is a major global health concern and is considered the most serious type due to its high prevalence and potential to cause chronic infection with life-threatening complications.[1,2] HBV is often referred to as a "silent disease," as infected individuals are usually asymptomatic carriers, allowing the infection to spread undetected.[1,2]

REVIEW

Langerhans cells in health and oral diseases - A review

Varsha Ajit Sangle[1], Noopur Kulkarni[2], Smita Chaware[3], Dipali Gundre[4], Harshada Pattar[5], Aditi Chandak[6]

Abstract

The oral mucosa is constantly exposed to pathogens and harmless foreign antigens like bacteria. It shows the presence of Langerhans' cells (LCs) which are the important antigenpresenting cells. LCs are responsible for detecting the antigens, recruiting Tcells, and thereby initiating the immune response. Main hallmark of LCs is the presence of Birbeck's granules. LCs originate prenatally in the epidermis by yolk sac macrophages. While, oral mucosal LCs are derived post-natally in the bone marrow by pre-dendritic cells. Main markers of LCs include- CD1a, S-100, Langerin with Langerin being the most specific marker. All the major lesions of oral cavity are influenced mainly by CD1a. Oral mucosal LCs are capable of engaging and internalizing a wide variety of pathogens. Hence they have been found in various diseases affecting oral cavity like oral candidiasis, oral lichen planus, periodontal diseases, gingivitis, median rhomboid glossitis, various periapical inflammatory conditions/ cysts, various premalignant lesions and conditions, and oral squamous cell carcinoma.

This literature review aims to comprehensively analyze existing literature on LC, focusing on its structure, origin, classification, and its influence on oral mucosal diseases.

Scientific databases were searched for the literature and relevant articles were selected for the review. Articles published in electronic databases like PubMed, Scopus, Science Direct and Research gate were selected and reviewed. Eligible study materials were original case reports, review articles in English related to immunohistochemistry, LCs in different oral mucosal diseases, and pathophysiology of LCs.

LCs are a critical component of primary immune response, capable of capturing protein antigens in the oral epithelium and presenting them to specific T cells in the context of MHC II molecules. Their density and distribution in oral pathologic conditions may reflect different immunological mechanisms involved in the pathogenesis of these diseases.

Keywords: Langerhans' cells, Birbeck granules, Epidermis, Oral mucosa, Yolk sac macrophages, CD1a, S-100, Langerin

Introduction

Immune response to any antigen is brought about by three types of cells- "Antigen presenting cells, T cells and B cells.

Langerhans cells (LCs) are the antigen presenting cells present in the epithelia of the skin and mucosa. They are myeloid cells residing in the epidermis of skin, and epithelium of corneal, buccal, gingival and genital mucosa. They were initially considered as neuritic in origin, but later of bone marrow origin. They express high levels of MHC II proteins. They act as sentinels in the early detection of foreign antigens. These cells were discovered by Paul Langerhans in 1868, but later named as 'Langerhans Cells' by Sigmund Merkel (1875). Because of their efficient antigen trapping properties and their capacity to generate strong co-stimulatory signals, LCs play a key role in the primary immune response. They are also able to secrete inflammatory chemokines that contribute to the recruitment of effectors cells such as macrophages, granulocytes, and additional dendritic cells to early inflammatory lesions. Now, LCs are re-classified as macrophages.

The immune system plays a noticeable role in wide varieties of oral pathological conditions- such as gingivitis, periodontitis, gingival enlargements, oral malignancy and premalignancy, mucosal infections, periapical inflammatory

Abstract

Oral Submucous Fibrosis (OSMF) is a potentially malignant disorder that affects the oral mucosa, causing pain, restricted mouth opening, and difficulty in oral functions. Conventional treatments often come with significant side effects and limited efficacy. This review explores the potential of natural herbal formulations, including curcumin, Aloe vera, licorice, and Triphala, in managing OSMF. The effectiveness, safety, and cost-effectiveness of these herbs are evaluated based on clinical studies, with a focus on symptom relief, fibrosis reduction, and prevention of malignant transformation. The findings suggest that these herbal formulations may offer a safer, more affordable, and less invasive alternative to conventional therapies. However, further clinical trials with standardized dosages and larger sample sizes are needed to confirm their efficacy.

Keywords: Oral Submucous Fibrosis, Herbal Formulations, Curcumin, Aloe Vera, Fibrosis Reduction.

1. INTRODUCTION

Oral Submucous Fibrosis (OSMF) is a debilitating, progressive disease primarily affecting the oral mucosa, characterized by fibrotic changes that limit mouth opening and result in significant functional impairment. This condition is predominantly found in individuals who regularly consume betel nut and tobacco products, with South and Southeast Asia being the most affected regions (Ray, Chatterjee, & Chaudhuri, 2019). The prevalence of OSMF is alarmingly high in countries such as India, where the incidence of malignant transformation has been estimated to range from 5% to 30%, making it a key public health concern (Warnakulasuriya & Ariyawardana, 2016).

In light of its malignant potential and the debilitating symptoms that affect daily oral functions such as eating, speaking, and swallowing, early detection and effective management of OSMF are paramount. However, despite efforts in treatment, the progressive nature of the disease, often coupled with a lack of curative therapies, exacerbates the challenge for clinicians worldwide.

Abstract

Soft-tissue pathologies frequently complicate orthodontic care by interfering with appliance fit, treatment mechanics, or patient compliance. While several textbooks address these lesions individually, no clinically oriented classification exists to guide orthodontic management. "OrthoPath" is a practical, color-coded framework that categorizes soft-tissue pathologies into seven distinct groups based on etiology, clinical behavior, and relevance to orthodontic treatment. This communication introduces and illustrates the utility of this system for timely recognition and appropriate intervention in routine orthodontic practice.

Keywords

Orthodontics, soft tissue pathology, classification, clinical decision-making

Received 15 July 2025; **revised** 16 August 2025; **accepted** 02 September 2025

Introduction

Orthodontic treatment necessitates long-term appliance wear and frequent intraoral manipulation, which predispose patients to a spectrum of soft-tissue lesions. These may include reactive hyperplasias, trauma-induced proliferations, infections, immune-mediated conditions, and occasionally, neoplastic changes. While many lesions are benign and self-limiting, others can significantly impact treatment outcomes, delay mechanics, or necessitate urgent referral.[1,2]

Despite the prevalence of such lesions, orthodontists lack a unified, treatment-oriented classification that integrates pathogenesis, clinical relevance, and management directives. Existing classifications in oral pathology focus on histopathologic and etiologic dimensions but offer limited guidance on how these lesions impact orthodontic treatment directly.[4,5,8,9]

OrthoPath fills this gap by providing a *clinically focused, color-coded classification system* that helps orthodontists triage soft-tissue pathologies based on urgency, required modifications, or the need to suspend or discontinue treatment.

Classification Framework of OrthoPath

Core Structure

The classification system comprises *seven primary categories (A–G)*, each based on *pathogenic mechanisms* and their *orthodontic implications*. Each category is assigned a *color code* indicating the required level of clinical action (Tables 1 and 2).

Clinical Implications

The clinical utility of *OrthoPath* lies in its real-time, chairside applicability. Unlike conventional pathology-focused

Abstract:

Artificial intelligence (AI) is revolutionizing dental imaging, enhancing diagnostic accuracy, efficiency, and time management in clinical practices. This paper systematically reviews the applications of AI in dental imaging, focusing on in-vitro studies that examine AI-driven methods for tooth segmentation, caries detection, bone segmentation, and 3D model creation. Through meta-analysis, we evaluate the performance of AI models in terms of diagnostic accuracy, including True Positive Rate (TPR), True Negative Rate (TNR), Positive Predictive Value (PPV), and Negative Predictive Value (NPV). Despite its promising potential, the integration of AI into clinical practice faces challenges related to data quality, model generalization, and ethical concerns. The paper concludes with insights into the future implications of AI, including its integration with other emerging technologies like 3D printing and robotic surgery. The successful implementation of AI in dentistry requires further clinical validation and resolution of existing limitations.

Keywords: *Artificial Intelligence, Dental Imaging, Caries Detection, Convolutional Neural Networks, 3D Modeling*

INTRODUCTION

Artificial intelligence (AI) has significantly impacted various fields of medicine, with dentistry being no exception. The integration of AI technologies into dental practice, particularly in the realm of dental imaging, has revolutionized diagnostic methods and treatment planning. Traditionally, dental imaging relied heavily on human expertise for analysis and interpretation, which could be time-consuming and prone to errors. However, the advent of AI in this domain has led to the development of advanced tools capable of improving the accuracy, efficiency, and time efficiency of dental diagnostic processes. AI-driven imaging technologies, such as machine learning (ML) and deep learning (DL), have shown the potential to enhance image interpretation, leading to more accurate diagnoses and better patient outcomes. Recent studies have highlighted the transformative potential of AI in dental imaging, particularly in tasks like detecting caries, segmenting teeth, and identifying abnormalities in radiographs. According to Lo Giudice et al. (2021), AI has been instrumental in reducing human error and increasing diagnostic precision, making it a powerful tool for dental professionals.

Dental imaging is foundational to modern dentistry. It aids in diagnosing various oral health conditions, planning treatments, and monitoring disease progression over time. Imaging modalities such as cone-beam computed tomography (CBCT), panoramic radiographs, and intraoral scans provide detailed visual representations of the oral and maxillofacial regions, enabling dental practitioners to detect issues that may not be visible during routine physical examinations. The traditional method of manually interpreting these images often requires extensive time and expertise, and even then, the risk of human error remains a concern. The incorporation of AI into dental imaging promises a substantial leap in both the speed and accuracy of

ABSTRACT

Background: Denture resins made of polymethyl methacrylate (PMMA) are often utilized because of their cost, aesthetic appeal, and simplicity of production. However, their mechanical characteristics, specifically, their flexural strength, are problematic, particularly when used in therapeutic settings for an extended period of time. The flexural strength of three PMMA denture resins that are sold commercially is assessed and contrasted in this research. **Materials and Methods:** *In vitro* tests were conducted on three different kinds of PMMA denture resins (Brands A, B, and C). By ISO 20795-1:2013 guidelines, 45 specimens (15 in each group) with measurements of 65 mm × 10 mm × 3 mm were created. To replicate oral circumstances, specimens were thermocyclically heated (5°C to 55°C) for 5,000 cycles after being polymerized in accordance with the manufacturer's instructions. A universal testing machine was used to perform a three-point bending test at a crosshead speed of 5 mm/min to assess flexural strength. Flexural strength (MPa) was calculated by recording the maximal force at fracture. Tukey's post-hoc test and one-way ANOVA were used for statistical analysis. **Results:** Brands A, B, and C have mean flexural strength values (±SD) of 65.3 ± 5.2 MPa, 72.5 ± 4.8 MPa, and 68.1 ± 6.0 MPa, respectively. The flexural strength of Brand B was substantially greater than that of Brands A and C ($P < 0.05$). But there was no discernible difference between Brands A and C ($P > 0.05$). **Conclusion:** In terms of mechanical durability, Brand B is a better option for denture bases since it showed the highest flexural strength among the evaluated materials. To assess other characteristics like impact strength and biocompatibility in clinical settings, further research is advised.

KEYWORDS: *Denture resins, flexural strength, in vitro study, polymethyl methacrylate, three-point bending test*

INTRODUCTION

Denture bases often employ polymethyl methacrylate (PMMA) because of its advantageous qualities, which include cost-effectiveness, manufacturing convenience, and aesthetically pleasing appearance.[1] However, under functional and parafunctional stresses, its relatively low mechanical strength, especially its flexural strength, presents difficulties for clinical

Abstract

Over-the-counter (OTC) analgesics are commonly used for the initial management of dental pain due to their accessibility and fast-acting relief. In dentistry, medications such as ibuprofen, paracetamol, and aspirin are frequently recommended for conditions ranging from toothache to postoperative discomfort and minor oral infections. These drugs are favored for their proven pharmacokinetics, including rapid onset and high oral bioavailability, making them valuable tools for both clinicians and patients. In addition to pharmacological treatments, non-drug adjuncts like cold therapy and chlorhexidine mouthwash are also employed to manage symptoms. However, the ease of access to OTC medications has led to challenges such as overuse, unsupervised consumption, drug interactions, and potential adverse effects, particularly in vulnerable populations. This review explores current trends in the use of OTC analgesics within dental practice, evaluates their mechanisms of action and clinical effectiveness, and addresses concerns surrounding their safe use. By examining these factors, the paper aims to highlight the therapeutic benefits and potential risks associated with self-medication practices in dental pain management. Ultimately, it underscores the importance of increased patient education and professional oversight to ensure safe, effective, and evidence-based use of these common analgesics, thereby reducing health hazards and improving overall outcomes in dental care.

Keywords: Analgesics, COX, Dental Pain, NSAIDS, OTC.

Introduction

Dental pain is a frequent and often distressing experience that can significantly impact an individual's quality of life. From a simple toothache to post-surgical discomfort, the need for effective pain management in dentistry is paramount (1). Over-the-counter (OTC) analgesics play a crucial role in addressing this need, providing readily accessible and convenient options for managing mild to moderate dental pain (2). These medications, available without a prescription, empower individuals to take control of their pain relief, offering a sense of autonomy and immediate symptom management (2). However, the ease of access and self-administration also raise concerns about potential misuse, overuse, and adverse effects (3).

Paracetamol (acetaminophen) is an antipyretic and analgesic drug with little to no anti-inflammatory action. It is an effective drug to use for postoperative pain following any dental procedure as it is a reportedly safe drug to use in patients with contraindications to other NSAIDs. Ibuprofen, a non-steroidal anti-inflammatory drug (NSAID), is most commonly used in dentistry due to its potent analgesic, antipyretic and anti-inflammatory properties. Ibuprofen's anti-inflammatory properties help reduce swelling and pain associated with dental procedures (4). Naproxen is another OTC NSAID with a longer duration of action than Ibuprofen making it convenient to manage persistent pain (5). Aspirin which is another NSAID with antipyretic, analgesic and anti-inflammatory properties, is less commonly used due to its higher tendency to cause gastrointestinal side effects and bleeding risks. It is rarely used in dentistry as it poses a higher risk of bleeding in the patient's undergoing dental surgery or extractions due to its irreversible

Langerhans cells in health and oral diseases - A review

Varsha Ajit Sangle[1], Noopur Kulkarni[2], Smita Chaware[3], Dipali Gundre[4], Harshada Pattar[5], Aditi Chandak[6]

Abstract

The oral mucosa is constantly exposed to pathogens and harmless foreign antigens like bacteria. It shows the presence of Langerhans' cells (LCs) which are the important antigenpresenting cells. LCs are responsible for detecting the antigens, recruiting Tcells, and thereby initiating the immune response. Main hallmark of LCs is the presence of Birbeck's granules. LCs originate prenatally in the epidermis by yolk sac macrophages. While, oral mucosal LCs are derived post-natally in the bone marrow by pre-dendritic cells. Main markers of LCs include- CD1a, S-100, Langerin with Langerin being the most specific marker. All the major lesions of oral cavity are influenced mainly by CD1a. Oral mucosal LCs are capable of engaging and internalizing a wide variety of pathogens. Hence they have been found in various diseases affecting oral cavity like oral candidiasis, oral lichen planus, periodontal diseases, gingivitis, median rhomboid glossitis, various periapical inflammatory conditions/ cysts, various premalignant lesions and conditions, and oral squamous cell carcinoma.

This literature review aims to comprehensively analyze existing literature on LC, focusing on its structure, origin, classification, and its influence on oral mucosal diseases.

Scientific databases were searched for the literature and relevant articles were selected for the review. Articles published in electronic databases like PubMed, Scopus, Science Direct and Research gate were selected and reviewed. Eligible study materials were original case reports, review articles in English related to immunohistochemistry, LCs in different oral mucosal diseases, and pathophysiology of LCs.

LCs are a critical component of primary immune response, capable of capturing protein antigens in the oral epithelium and presenting them to specific T cells in the context of MHC II molecules. Their density and distribution in oral pathologic conditions may reflect different immunological mechanisms involved in the pathogenesis of these diseases.

Keywords: Langerhans' cells, Birbeck granules, Epidermis, Oral mucosa, Yolk sac macrophages, CD1a, S-100, Langerin

Introduction

Immune response to any antigen is brought about by three types of cells- "Antigen presenting cells, T cells and B cells.

Langerhans cells (LCs) are the antigen presenting cells present in the epithelia of the skin and mucosa. They are myeloid cells residing in the epidermis of skin, and epithelium of corneal, buccal, gingival and genital mucosa. They were initially considered as neuritic in origin, but later of bone marrow origin. They express high levels of MHC II proteins. They act as sentinels in the early detection of foreign antigens. These cells were discovered by Paul Langerhans in 1868, but later named as 'Langerhans Cells' by Sigmund Merkel (1875). Because of their efficient antigen trapping properties and their capacity to generate strong co-stimulatory signals, LCs play a key role in the primary immune response. They are also able to secrete inflammatory chemokines that contribute to the recruitment of effectors cells such as macrophages, granulocytes, and additional dendritic cells to early inflammatory lesions. Now, LCs are re-classified as macrophages.

The immune system plays a noticeable role in wide varieties of oral pathological conditions- such as gingivitis, periodontitis, gingival enlargements, oral malignancy and premalignancy, mucosal infections, periapical inflammatory
